TO SUPPORT YOU, WE DESIGN AND PRODUCE

An industrialized process with various levels
of customization

For over 40 years, Rollon has adopted an approach entailing responsibility and ethics in the design and production of our linear motion solutions for different industrial sectors. The reliability of an international technology group has now been combined with the availability of a local support and service network

VALUES

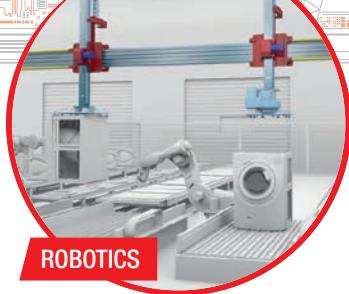

PERFORMANCE

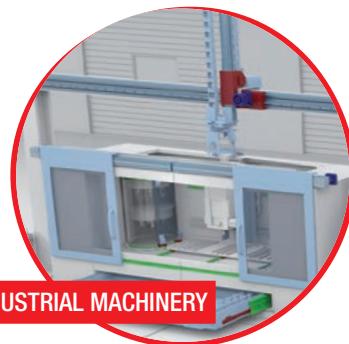

Rollon's goal is to help our clients become more competitive in their markets through technological solutions, design simplification, productivity, reliability, duration, and low maintenance.

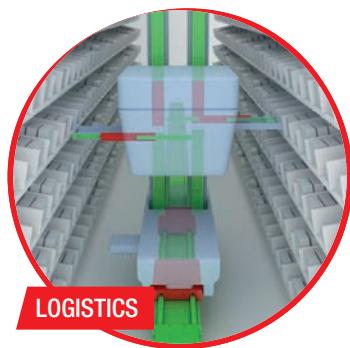

ROBOTICS

INDUSTRIAL MACHINERY

LOGISTICS

RAILWAY

COLLABORATION

High-level technical consulting and cross-competence allow us to identify the needs of our clients and transform them into guidelines for continuous exchange, while our strong specialization in the different industrial sectors becomes a factor in developing projects and innovative applications.

SOLUTIONS APPLICATIONS

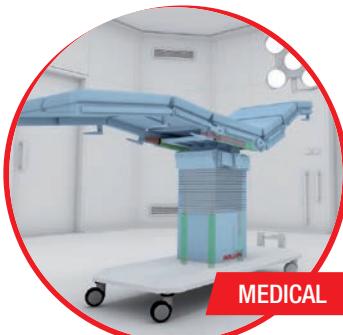

Rollon takes on the task of design and development of linear motion solutions, taking care of everything for our customers, so that they can concentrate on their core business. We offer everything from individual components to specifically designed, mechanically integrated systems: the quality of our applications is an expression of our technology and competence.

INTERIORS AND ARCHITECTURE

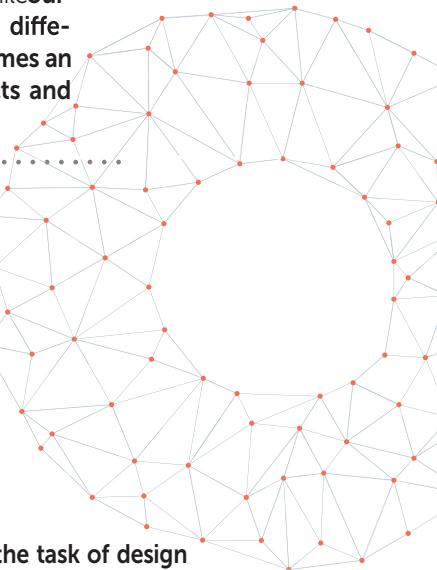

MEDICAL

SPECIAL VEHICLES

AERONAUTICS

DIVERSIFIED LINEAR SOLUTIONS FOR EVERY APPLICATION REQUIREMENT

Linear and telescopic rails

Linear Line

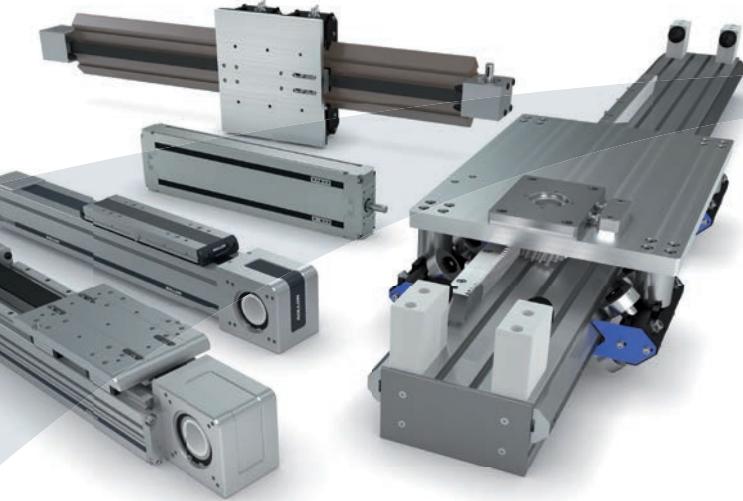

Linear and curved rails with ball and roller bearings, with hardened raceways, high load capacity, self-alignment, and capable of working in dirty environments.

Telescopic Line

Telescopic rails with ball and roller bearings, with hardened raceways, high load capacities, low bending, resistant to shocks and vibrations. For partial, total or extended extraction up to 200% of the length of the guide.

Linear actuators and automation systems

Actuator Line

Linear actuators with different rail configurations and transmissions, available with belt, screw, or rack and pinion drives for different needs in terms of precision and speed. Rails with bearings or ball recycle systems for different load capacities and critical environments.

Actuator System Line

Integrated actuators for industrial automation, used in applications in several industrial sectors: automated industrial machinery, precision assembly lines, packaging lines and high speed production lines. The Actuator Line evolves to satisfy the requests of our most discerning clients.

Reported data must be verified according to the application.

In many cases, special designs or alternative surface coatings are possible. For more information, please contact our technical department.

*¹ The over extension corresponds to 150 % stroke (1=150 % extraction). For a 200 % stroke (2=200 % extraction) please contact our technical department.

*² Different temperature ranges from -30 °C to +250 °C, This must be verified according to the application.

*³ The load capacity for aluminum is 40 % and for stainless steel 60 % of the stated values, if available in this material variant.

*⁴ Different stainless steels, such as the «electropolishing» option, are available. For more information, please contact our technical department.

*⁵ The availability of locking systems depends on the system length and varies per product group. For more information, please contact our technical department.

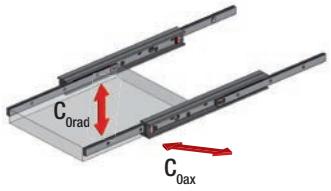

*⁶ The operating temperature is maximum +50°C if damping is used. For more information, please contact our technical department.

*⁷ The maximum value is defined by the application. For more information, please contact our technical department.

Telescopic Rail

Product explanation

➤ Telescopic Rail: Seven models with full and partial extension

Fig. 1

The Telescopic Rail product line is made up of seven models with full and partial extension and various cross-sections and intermediate elements in S-shape, I-beam or square. High loads in combination with cost-efficiency and free movement have long been the outstanding properties of the Telescopic Rail product line.

The most important characteristics:

- High load capacity with low deflection
- Rigid intermediate elements
- Standardized hole locations
- Zero-play running even with maximum load
- Space saving design
- High reliability

Preferred areas of application of the Telescopic Rail product family:

- Railcars (e. g. maintenance and battery extensions, doors)
- Construction and machine technology (e.g., housings and doors)
- Logistics (e.g., extensions for containers or gripper movements)
- Automotive technology
- Packaging machines
- Beverage industry
- Special machines

ASN

Partially extending telescopic rail consisting of a guide rail and a slider. This compact and simple design allows for very high load capacities. When the guide rail is mounted to a structure a very high rigidity system is created.

Fig. 2

T
R**DS**

Fully extending telescopic rail consisting of a fixed guide rail, an identical moving guide rail, and an S-shaped intermediate element. This has a high moment of inertia and high rigidity in a slim size. This results in a high loading capacity with low deflection in the extended state.

The DS series is available in three different designs: DSS version with single direction stroke, DSB version with single direction stroke and locking capability in the closed position, and DSD version with double direction stroke. DS...S version available with reinforced and damped stainless steel end stops.

Fig. 3

DSE

Telescopic rail with a 150% extension of its length, made by four elements. It has a high rigidity, thanks to the intermediate elements with a high moment of inertia, in a streamlined shape.

This results in a high load capacity, with reduced bending even when the telescopic guide is fully extended.

Fig. 4

DSC

Fully extending telescopic rail consisting of a compact and flexurally rigid intermediate element that connects two different sized guide rails with each other as a fixed and moving element.

This design makes it possible to reduce all components to the necessary size and length for achieving the full stroke. The DSC series features high rigidity and a high load capacity in a compact size. This results in an optimal combination of performance and weight reduction.

Fig. 5

DE

Fully extending telescopic rail consisting of two guide rails, which are mounted on an I-beam profile to form the intermediate element, one moveable slider and one fixed slider which mounts onto the structure. The square cross-section allows a compact size with high load capacities and low deflection, especially with radial loading. Also available with a double stroke design, which includes an eccentrically located driving disc for simultaneous movement. For double sided extensions, a dedicated DE...D version is available with a driving disc.

DE...S version available with reinforced and damped stainless steel end stops.

Fig. 6

DBN

Fully extending telescopic rail consisting of two guide rails, one which is fixed to a structure, and one which is moveable, and two sliders which are mounted together and form the intermediate element. The size is similar to the DE series and offers good protection from contamination of the ballcage.

Fig. 7

DMS

Heavy load telescopic consisting of elements from the ASN series and an extremely rigid I-beam profile as the intermediate element. This fully extending telescopic rail is used to accept very heavy loads with low deflection.

Technical data

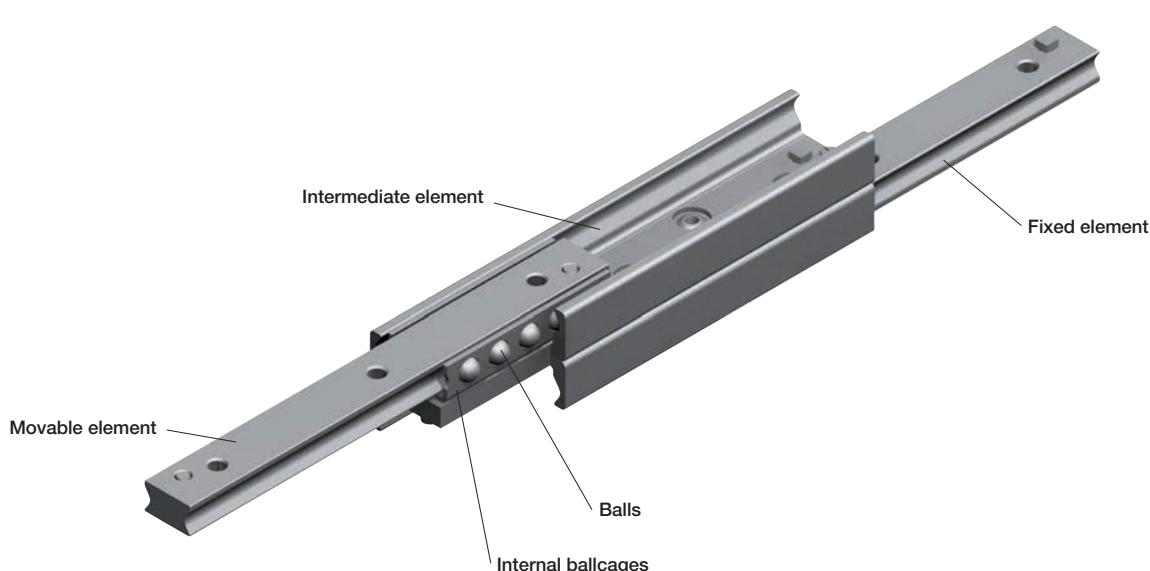

Fig. 33

Performance characteristics:

- Available sizes ASN / DE: 22, 28, 35, 43, 63
- Available sizes DS: 28, 35, 43, 63
- Available sizes DSE: 28, 35, 43, 63
- Available sizes DSC: 43
- Available sizes DBN: 22, 28, 35, 43
- Available size DMS: 63
- Induction hardened raceways
- Rails and sliders made of cold-drawn roller bearing carbon steel
- Balls made of hardened roller bearing carbon steel
- Max. operating speed: 0.8 m/s (31.5 in/s)
(depending on application)
- DE...S and DSS...S temperature range: -20°C to +50°C (-4°F to +122°F)
- ASN, DE, DBN, temperature range: -20 °C to +170 °C (-4 °F to +338 °F), DS, DSE, DSC and DMS: -20 °C to +80 °C (-4 °F to +176 °F)
- Electrolytic galvanised as per ISO 2081, increased anticorrosive protection on request (see pg. TR-43 Anticorrosive protection)

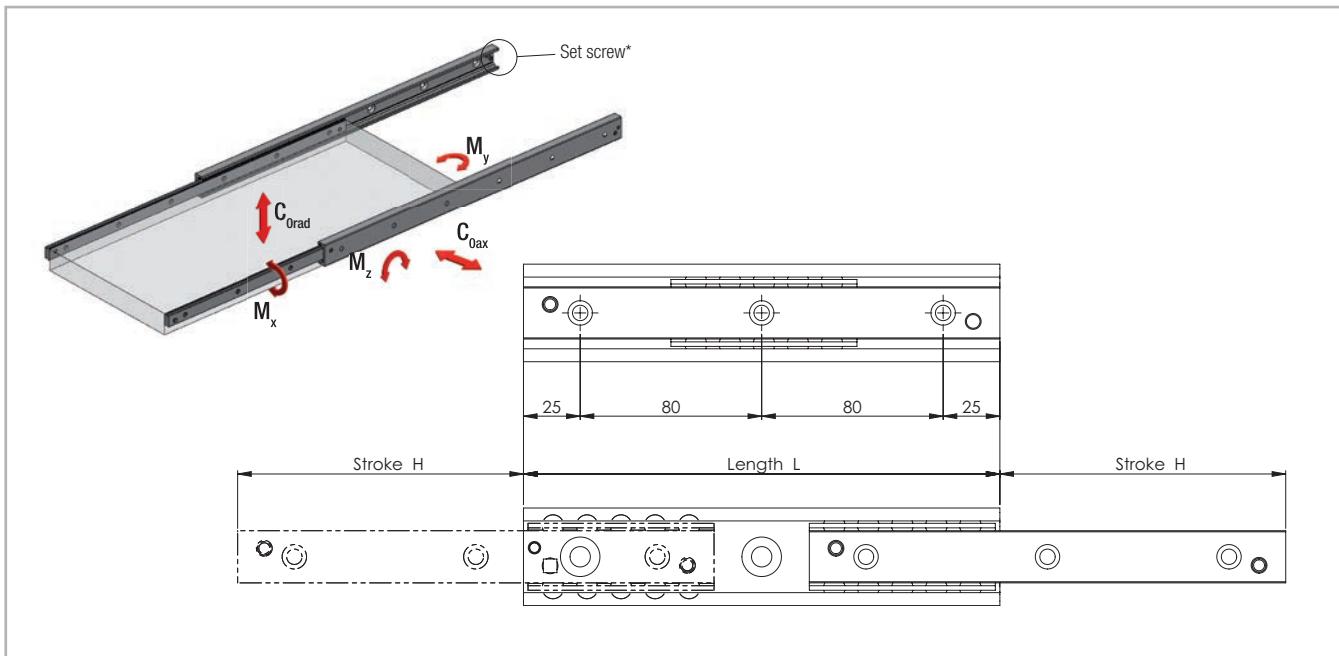

Remarks:

- All load capacity data are based on a pair of telescopic rails except the value M_x of ASN series (see pag. TR-8, TR-9, TR-10)
- Horizontal movement installation is recommended
- Vertical movement installation on request
- External end stops are recommended
- Double-sided stroke in ASN, DSD, DE, DBN series (DMS on request)
- Custom strokes on request
- All load capacity data is based on continuous operation
- Calculation of the service life is based exclusively on the loaded rows of balls
- For models DMS, DSB, and DSE, please observe right or left side use
- Fixing screws of property class 10.9 must be used for all telescopic rails
- Internal stops are used to stop the unloaded slider and the ball cage.
Please use external stops as end stops for a loaded system

Dimensions and load capacity

> ASN

* Remove the set screw to reach all the fixing holes. See also assembly instructions on page TR-45f.

> DSB

B version with locking system for closed position

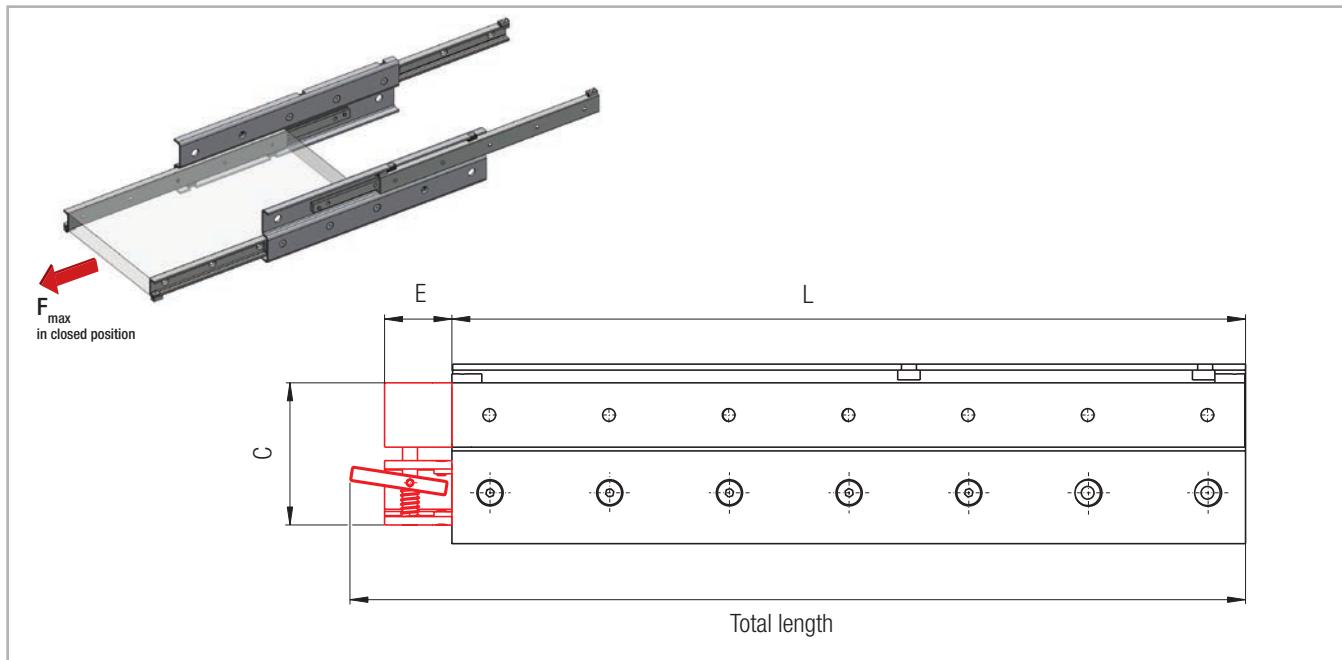

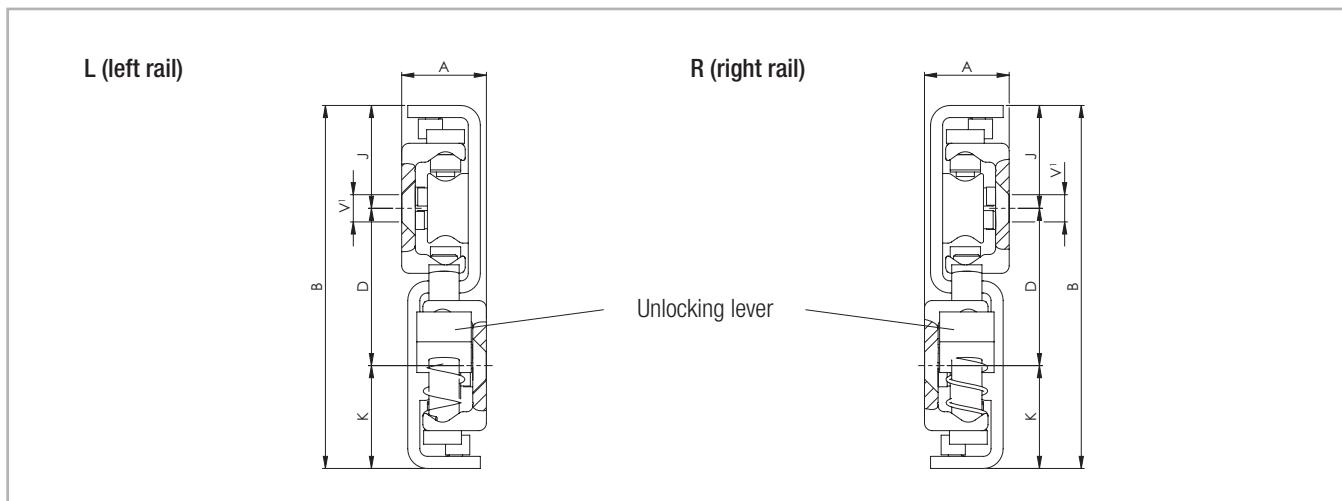

Fig. 40

¹ Fixing holes (V) for countersunk head screws according to DIN 7991

Fig. 41

The DSB is built on the DSS design. The same load capacities, cross-sections and available rail lengths apply (see pg. TR-12ff). Data in Table 12 are based on the special features of the locking mechanism.

Please observe right or left installation for version DSB.
The maximum load on the locking when closed is indicated by F_{\max} .

Type	Size	L [mm]	Total length [mm]	C [mm]	E [mm]	F_{\max}^{2} [N]	Weight per single guide [kg/m]
DSB	28	from 290 to 1490*	L + 52	63	35	2460	6.51
	35	from 450 to 1730*	L + 53	78	33	3000	10.4
	43	from 530 to 1970*	L + 69	95	45	5630	14.98

* For available lengths, see pg. TR-12, tab. 5 and 7 (DSS)

² Value referred to one locking mechanism, for application we always suggest to have 2 rails both equipped with locking mechanism.

Please note the technical information "Double-sided stroke" on page TR-42

Tab. 30

There are three options for mounting holes available for the DE series in sizes 22 to 43:

Version DEF with threaded holes,

Version DEV with counter-sunk holes,

Version DEM, both variants (mixed) (see fig. 52).

Size 63 is only available with threaded holes.

> DE...D

DED with double direction stroke (double stroke)

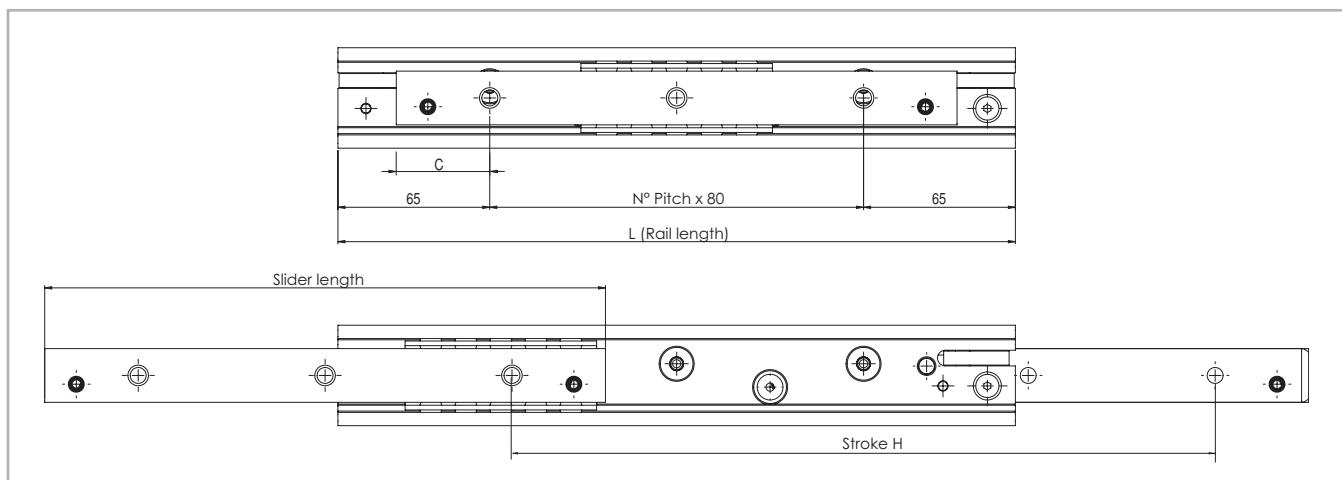

Fig. 52

D version (with a driving disc)

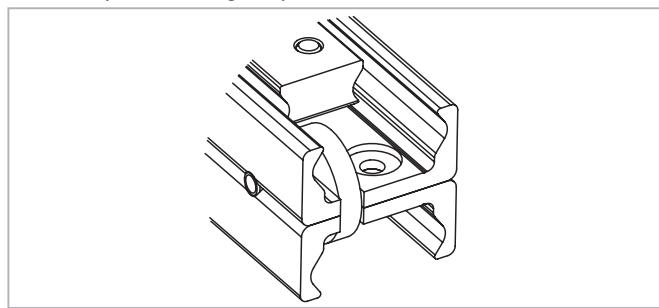

Fig. 53

The driving disc in the intermediate element in the DE...D versions acts to make sure that in bilateral strokes (double strokes) the intermediate element always returns to the correct position and does not remain in an undefined position. This design is available in sizes 28, 35, 43 and 63 with all three versions of the fixing holes. This version is based on the standard DE series version, but differs in the technical characteristics for the construction methods. Please contact our technical service department for more information.

Technical instructions

> Telescopic rail selection

Selecting the suitable telescopic rail should be done based on the load and the maximum permissible deflection in the extended state. The load capacity of a telescopic rail depends on two factors: the loading capacity of the ballcage and the rigidity of the intermediate element. For mainly short strokes the load capacity is determined by the load-bearing capacity of the ballcage; for average and long strokes it is determined by the rigidity of the intermediate element. Therefore series, which otherwise contain comparable components, are also suited for differing load capacities.

> Static load check

The values in the load capacity tables of the corresponding series (see Sect. 4, Product Dimensions, pg. TR-8ff) give the maximum permissible loading of a pair of rails in the middle of the two rails and in the center line of the moving element with the rails in the completely extended state.

Using a pair of rails, the loading acts in the centre on both rails (see fig. 62, P).

The load capacity of a rail pair is:

$$C_{0\text{rad}}$$

Fig. 61

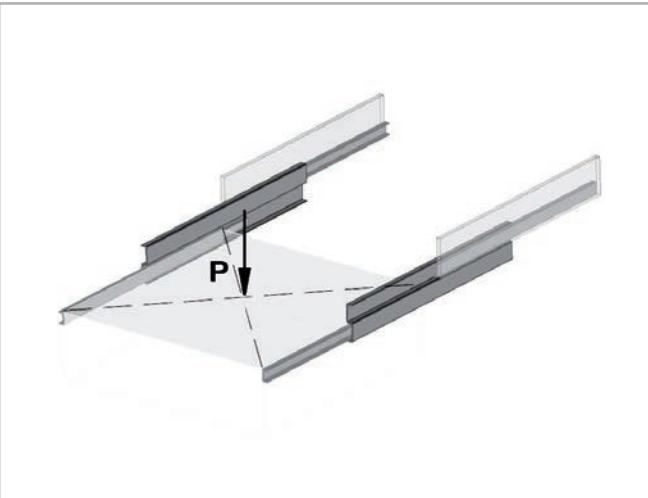

Fig. 62

> Deflection

If the load P acts vertically on the pair of rails (see fig. 65), the expected elastic deflection in the extended state can be determined as follows:

$$f = \frac{q}{t} \cdot P \quad (\text{mm})$$

Fig. 63

Whereby:

f is the expected elastic deflection in mm

q is a stroke coefficient (see fig. 66/67)

t is a factor depending on the model of the telescopic rail (see fig. 64)

P is the actual load acting on the centre of a pair of rails, in N

Also refer to page TR-38 for checking the static load

DE63	$t = 1080$	DSE43	$t = 116$
		DSE63	$t = 556$

Fig. 64

This estimated value assumes an absolutely rigid adjacent construction.

If this rigidity is not present, the actual deflection will deviate from the calculation.

Important:

With the partial extensions of the ASN series, the deflection is almost completely determined by the rigidity, i.e. by the moment of inertia of the adjacent construction.

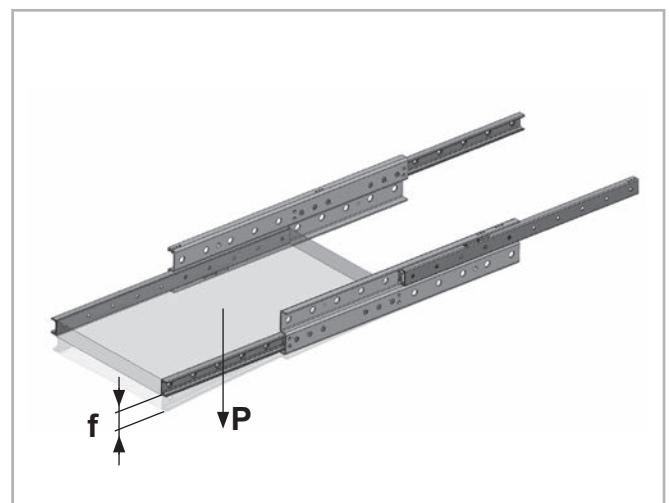

Fig. 65

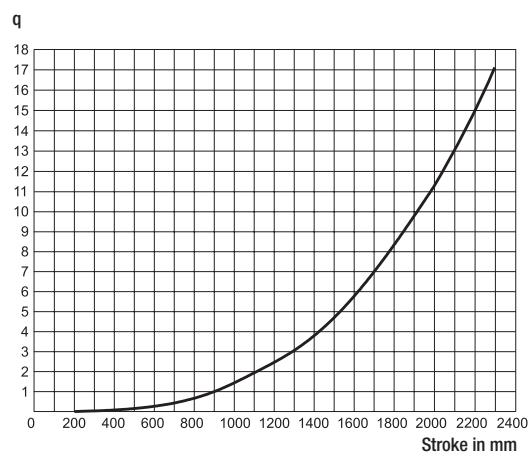

Fig. 66

For rail type DSE

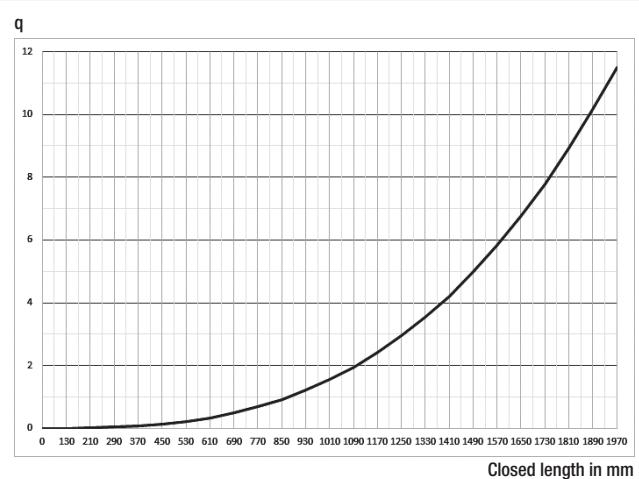

Fig. 67

> Static load

The telescopic extension of the various series allow different forces and moments (see Sect. 4, Product dimensions, pg. TR-8ff).

During the static tests the radial load capacity, C_{0rad} , the axial load capacity, C_{0ax} , and moments M_x , M_y and M_z indicate the maximum permissible values of the loads; higher loads negatively effect the running properties

and the mechanical strength. A safety factor, S_0 , is used to check the static load, which takes into account the basic parameters of the application and is defined in more detail in the following table:

Safety factor S_0

Neither shocks nor vibrations, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations	1.5
Normal installation conditions	1.5 - 2
Shocks and vibrations, high-frequency reverse, significant elastic deformation	2 - 3.5

Tab. 49

The ratio of the actual load to maximum permissible load may be as large as the reciprocal of the accepted safety factor, S_0 , at the most.

$\frac{P_{0rad}}{C_{0rad}} \leq \frac{1}{S_0}$	$\frac{P_{0ax}}{C_{0ax}} \leq \frac{1}{S_0}$	$\frac{M_1}{M_x} \leq \frac{1}{S_0}$	$\frac{M_2}{M_y} \leq \frac{1}{S_0}$	$\frac{M_3}{M_z} \leq \frac{1}{S_0}$
--	--	--------------------------------------	--------------------------------------	--------------------------------------

Fig. 68

The above formulas are valid for a single load case. If two or more of the described forces act simultaneously, the following check must be made:

$\frac{P_{0rad}}{C_{0rad}} + \frac{P_{0ax}}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \leq \frac{1}{S_0}$	P_{0rad} = effective radial load C_{0rad} = permissible radial load P_{0ax} = effective axial load C_{0ax} = permissible axial load M_1 = effective moment in the x-direction M_x = permissible moment in the x-direction M_2 = effective moment in the y-direction M_y = permissible moment in the y-direction M_3 = effective moment in the z-direction M_z = permissible moment in the z-direction
--	--

Fig. 69

> Service life

The service life is defined as the time span between commissioning and the first sign of fatigue or wear indications on the raceways. The service life of a telescopic rail is dependent on several factors, such as the effective load, the installation precision, occurring shocks and vibrations, the operating temperature, the ambient conditions and the lubrication. Calculation of the service life is based exclusively on the loaded rows of balls.

In practice, the decommissioning of the bearing, due to its destruction or extreme wear of a component, represents the end of service life.

This is taken into account by an application coefficient (f_i in the formula below), so the service life consists of:

$$L_{km} = 100 \cdot \left(\frac{\delta}{W} \cdot \frac{1}{f_i} \right)^3$$

L_{km} = calculated service life in km

δ = load capacity factor in N

W = equivalent load in N for a pair of rails

f_i = application coefficient

Fig. 70

Application coefficient f_i

	ASN, DS, DE, DBN, DSC
Neither shocks nor vibrations, smooth and low-frequency direction change, clean environment	1.3 - 1.8
Light vibrations and average direction change	1.8 - 2.3
Shocks and vibrations, high-frequency direction change, very dirty environment	2.3 - 3.5

Tab. 50

If the external load, P , is the same as the dynamic load capacity, C_{0rad} , (which of course must never be exceeded), the service life at ideal operating conditions ($f_i=1$) amounts to 100 km.

Naturally, for a single load P , the following applies: $W=P$. If several external loads occur simultaneously, the equivalent load is calculated as follows:

$$W = P_{rad} + \left(\frac{P_{ax}}{C_{0ax}} + \frac{M_1}{M_x} + \frac{M_2}{M_y} + \frac{M_3}{M_z} \right) \cdot C_{0rad}$$

Tab. 52

> Speed

The maximum operating speed is determined by the mass of the intermediate element, which moves with the movable rail. This reduces the maximum permissible operating speed with increasing length (see fig. 72).

Maximum acceleration: 1.2 m/s²

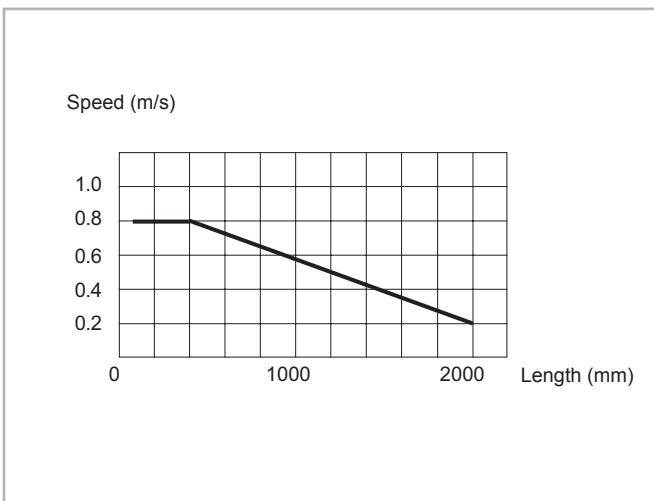

Fig. 72

> Opening and closing force

The required actuation forces of a telescopic rail depend on the acting load and the deflection in the extended state. The force required for opening is principally determined by the coefficient of friction of the linear bearing. With correct assembly and lubrication, this is 0.01. During the extension, the force is reduced with the elastic deflection of the loaded

telescopic rail. A higher force is required to close a telescopic extension, since, based on the elastic deflection, even if it is minimal, the movable rail must move against an inclined plane.

> Double-sided stroke

For all designs allowing double-sided stroke, it must be noted that the position of the intermediate element is defined only in the extended state. In the extended state, the intermediate element can protrude by half of its length on each side. Exception is the ASN series, which comes out as a partial extension without an intermediate element and the custom design of series DE with driving disc.

The double-sided stroke in the ASN, DE and DBN series is achieved by removing the set screw. For the DSD series, the double-sided stroke is implemented by design adaptation. Double-sided stroke for series DMS on request. The DSB series are not available with double-sided stroke.

> Temperature

- ASN, DE, DBN series can be used up to an ambient temperature of +170 °C (+338 °F). A lithium lubricant for high operating temperatures is recommended for temperatures above +130 °C (+266 °F). Minimum temperature with standard grease is -20 °C (-4 °F).
- The DS, DSE, DSC and DMS series have a useable range of -20 °C to +80 °C (-4 °F to +176 °F) due to the rubber stop.
- The DSS43S and DE..S series have a temperature range of application from -20 °C to + 50 °C (-4 °F to 122 °F), due to the bumpers in special resin.

> Anticorrosive protection

Treatment	Characteristics
Zinc Plating ISO 2081	Standard treatment for rails it is ideal for indoor applications. Zinc-plated telescopic rails are supplied with steel balls
ZincNickel ISO19598 (Z)	Ideal for outdoor applications. Telescopic rails with this treatment are supplied with stainless steel balls to further increase the corrosion resistance.
Rollon E-coating (K)	Electro painting that provides a fine black finishing to the entire rail. It can be partially removed from the raceways on the running contact point of the balls after a period of use. Telescopic rails with Rollon E-Coating are supplied with stainless steel balls to further increase the corrosion resistance.
Nickel Plating (N)	Provides high resistance to chemical corrosion and is ideal for applications in medical or food related environments. Raceways are coated too. Telescopic rails with Nickel Plating are supplied with stainless steel balls to further increase the corrosion resistance.

Tab. 53

- Numerous application-specific surface treatments are available upon request, e.g., FDA approved nickel plating for use in the food industry.
For more information please contact Rollon technical support.
For specific information, contact Rollon technical support.

> Lubrication

Recommended lubrication intervals are heavily dependent upon the ambient conditions, speed and temperature. Under normal conditions, lubrication is recommended after 100 km operational performance or after an operating period of six months. In critical application cases the interval should be shorter. Please clean the raceways carefully before lubricating. Raceways and spaces of the ball cage are lubricated with a lithium lubricant of average consistency (roller bearing lubricant).

Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For specific information, contact Rollon technical support.

> Clearance and preload

Telescopic Rail guides are mounted as standard with no play. For more information, please contact Rollon technical support.

Preload classes		
Increased clearance	No clearance	Increased preload

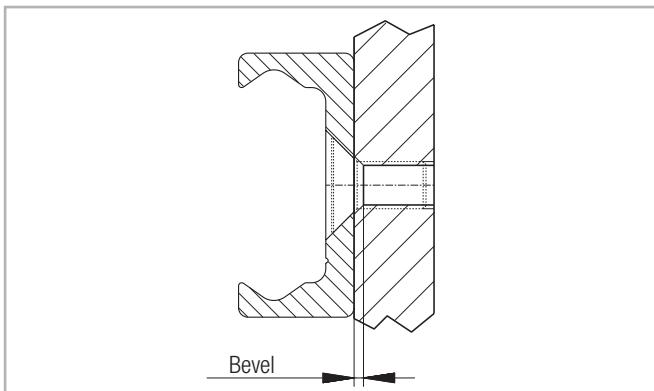

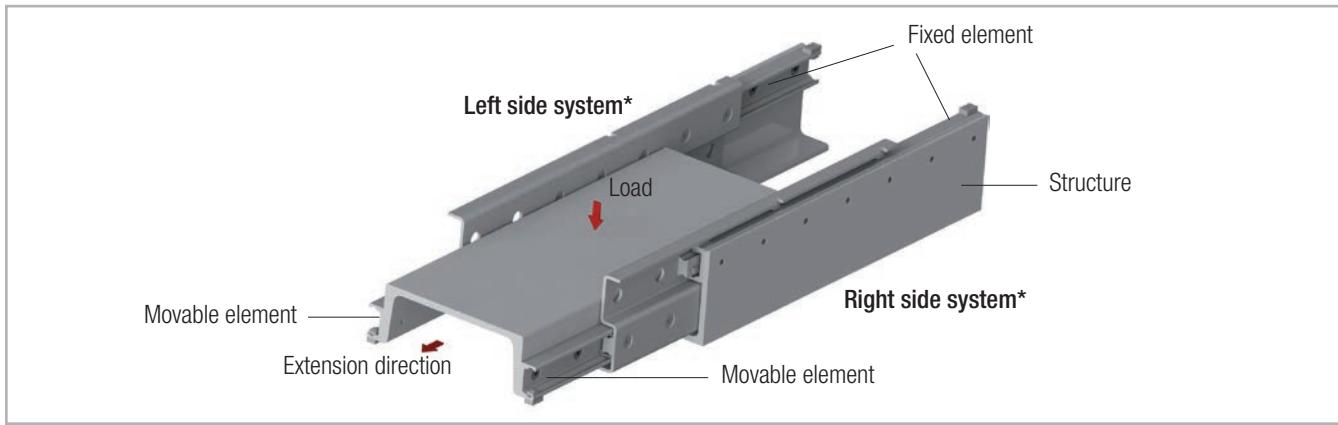

Fig. 74

> Installation instructions

In general and for ASN, DBN, DE, DMS, DSB, DSE

* For models DMS, DSB, and DSE, please observe right or left side use

Fig. 75

General

- Internal stops are used to stop the unloaded slider and the ball cage. Please use external stops as end stops for a loaded system.
- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the telescopic rails with all accessible holes on a rigid and level surface.
- In order to reach all mounting holes for the ASN, DEV, DEM and DBN series it is necessary to remove the locking screw in the rail during assembly and then to reinsert it afterwards.
- Please observe the parallelism of the installation surfaces. The fixed and movable rails fit to the rigid assembly construction.
- Telescopic Rail guides are suitable for continuous use in automatic systems. For this, the stroke should remain constant in all moving cycles and the operating speed must be checked (see pg. TR-42, fig. 72). The movement of the telescopic rails is enabled by internal ballcages, which could experience an offset from the original position with differing strokes. This phase offset can have a negative effect on the running properties or limit the stroke. If differing strokes occur in an application, the drive force must be sufficiently dimensioned in order to appropriately synchronise the ballcage offset. Otherwise, an additional maximum stroke must be planned regularly to ensure the correct position of the ballcage.

ASN

- Series ASN accepts radial and axial loads and moments in all principle directions.
- The installation of two partial extensions on a profile provides a load capable full extension. For individual solutions, please contact Rollon technical support.

DE / DBN

- Series DE and DBN accept radial and axial loads.
- The functionality of custom design DE...D is only guaranteed if the stroke available is completely used.

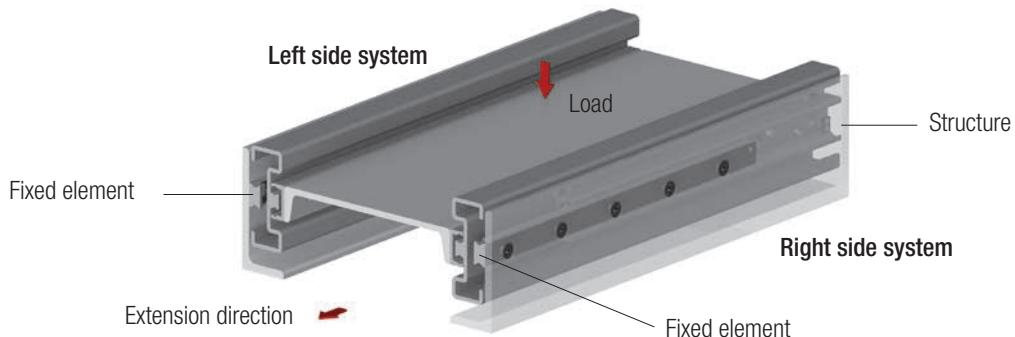

DS / DSE / DMS

- Series DS, DES, DMS accept radial loads. This should act in the vertical cross-sectional axis on the movable rails.
- When installing make sure that the load is placed on the movable element (the lower rail) (see fig. 75). The opposite assembly negatively affects the function.
- Installation must be done on a rigid structure using all accessible fixing holes.
- Pay attention to the parallel alignment during assembly with paired application.

> Installation instructions

For DSC

DSC system in retracted state

DSC system in extended state

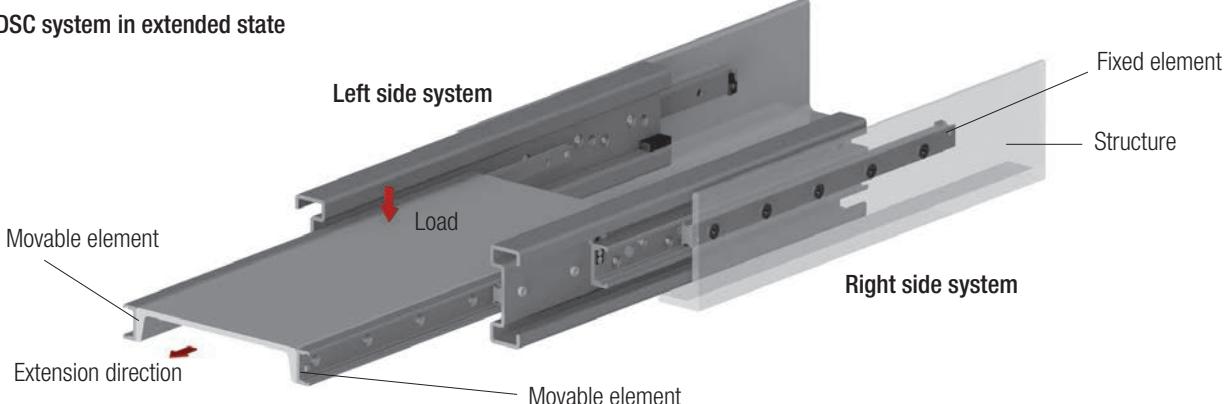

Fig. 76

DSC

- The DSC series absorbs radial and axial loads, in which case radial load directions are preferable.
- Horizontal and vertical use is possible. Prior to vertical installation we recommend inspection by the application engineers.
- During installation make sure that the load is mounted on the movable element (see Fig. 76). Reverse installation will impair proper functioning.
- The installation must be performed on a rigid structure, using all accessible mounting holes.
- Important: The length of the slider (fixed element) is different from the system length. See Table 23 on page TR-21 for DSC load ratings. The table also provides information on the accessible mounting holes.
- Important: The slide (fixed element) must be mounted in the front position when the system is retracted in order to achieve the entire stroke.
- Make sure the elements are aligned parallel during mounting.

Ordering example 2: DSB28-0690-0885-L-N

Ordering example 3 (rail DE...D): DEF28D-0690

Notes on ordering: Information for right and left side installation and for expanded surface protection is only necessary if required.

Rail lengths and stroke lengths are always stated with 4 digits. Please pad with zeroes to fill in for lengths with less than 4 digits, e.g. 515mm length is "0515"

> Special strokes

Special strokes are defined as deviations from standard stroke H. They are each available as multiples of the values in tab. 58 and 59.

These values are dependent on the spacing of the ballcage.

Hegra Rail

Product explanation

> Partial and full extension guides of different types

Fig. 1

The Hegra Rail product family consists of five product categories: partial, fully extending, overextending and heavy-duty rails as well as S-profiles. Different versions in the single categories, such as design or materials, also provide for increased customer benefits.

The most important characteristics:

- High load capacity and minimal deflection
- Different versions and materials
- Compact design
- Lightweight; smooth operation
- Long life
- High functional reliability

Preferred applications:

- Rail vehicles (maintenance and battery compartments)
- Motor vehicle technology
- Construction and machine technology
- Special purpose machinery

Partial extension guides

Partial extension guides with a stroke of more than 50 % of the closed telescoping length, consisting of one guide rail and one slider. The high system rigidity is achieved here in combination with the connection construction.

Fig. 2

Full extension guides

Full extension guides with strokes of about 100 % of the closed length consisting of three elements in different designs and sizes.

Fig. 3

Overextending guides

Overextending guides with a stroke of up to 200 % of the closed telescoping length. The use of intermediate elements with a high moment of inertia achieves excellent system rigidity and a high load capacity in fully extended systems.

Fig. 4

Heavy load extension guides

Full extension guides with strokes of about 100 % of the length consist of a solid, double T-shaped intermediate element and the two corresponding sliders. This full extension guide was specially designed for extremely heavy loads with minimal deflection and high system rigidity.

Fig. 5

S-profiles

Full extension guides with strokes of about 100 % of the closed length consisting of two guide rails and one S-shaped intermediate element. The advantages of the full extension guide are high rigidity and a compact design.

Fig. 27

Technical data

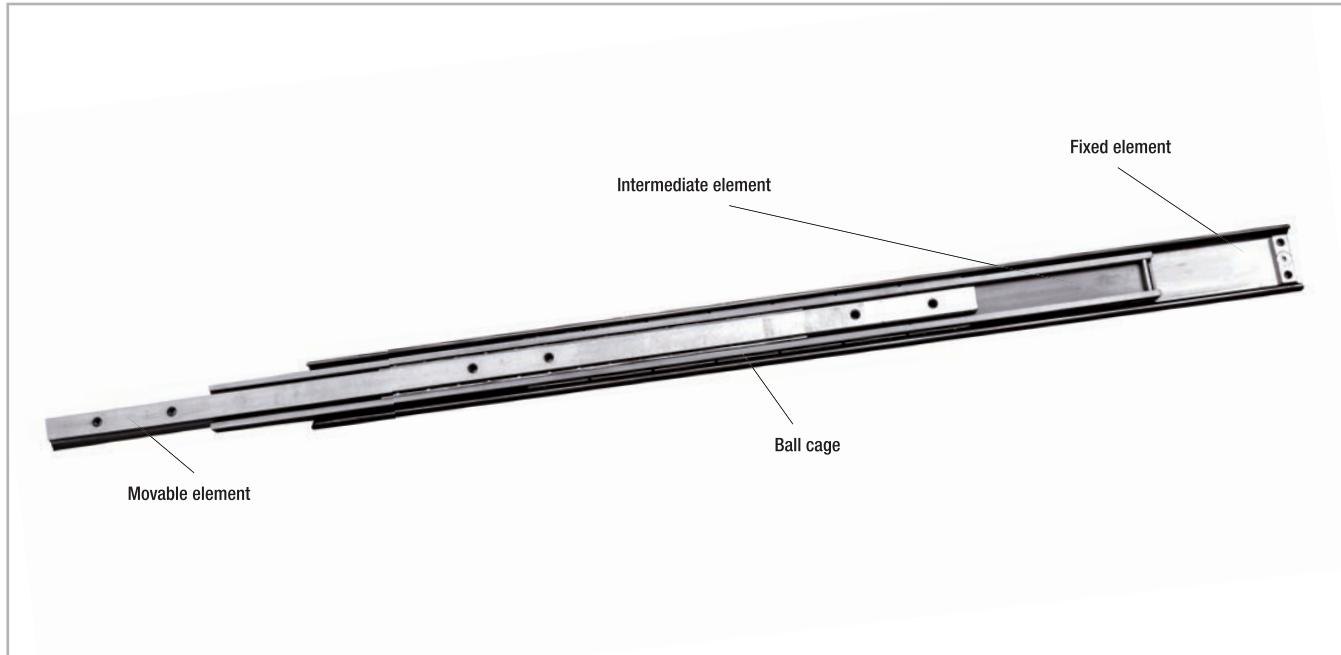

Fig. 28

Performance characteristics:

- Temperature range: -20 °C to +170 °C (-4 °F to +338 °F)
(in exceptions also -30 °C to +250 °C (-22 °F to +482 °F)
Above 80°C all rubber part, if they exist, must be removed.
- Max. operating speed 0.8 m/s (depending on the application)
- Different materials and anti-corrosion coatings are available
- Special solutions, such as locking mechanisms, catches, damping elements or are available on request

Attention!

The load capacity for aluminum is 40 % and for stainless steel 60 % of the stated values, if available in this material variant.

Notes:

- Horizontal movement installation is recommended
- Vertical movement installation on request
- Special strokes on request
- All load capacities refer to one telescopic pair
- Mounting screws with a strength class of 10.9 must be used for all telescopic rails
- Internal stops are provided to stop the sliders when not under load and the ball cage. Please use external stops as limit stops for a system under load
- Not all accessories (interlocks, damping, drive disk, snap) can be combined with each other. Please contact our technical service.
- For models HGT with locking please observe right or left side use.
- Temperature range: LTH
-20 °C to +170 °C (-4 °F to +338 °F)
- Temperature range: LTH ...S
-20 °C to +50 °C (-4 °F to +122 °F)
- Telescopic guides made of aluminum or stainless steel are standard without greasing. If a greasing is desired, it must be stated separately at the order.
- Please note eventually dimensional variations in use of stainless steel.
Please contact our technical service.

Accessories

Available options (depending on telescope version)

> Locking

Locking mechanisms make it possible to lock the Hegra rails in the end position. This prevents inadvertent extension or retraction of the rail in any case. Locking mechanisms can be implemented as locking bolts or bars. This ensures personal safety and protection of materials, especially in moving installations, as in vehicles. For models HGT with locking please observe right or left side use.

Fig. 55

Fig. 56

> Driving disc

In the full extension rails with dual stroke the intermediate element does not follow a particular order. The exact position of the element is therefore defined only in fully extended condition. The optional driving disc defines the movement of the intermediate element. This prevents unwanted protrusion of the element. An example for use of the driving disc is in warehouse rails, which are extended in both directions.

Fig. 57

Fig. 58

> Damping

Hegra telescoping rails can be equipped with damped end stops in closed position. Plastic or elastomer damping elements provide for quieter operation, a softer end stop when pushing in the rail and higher resistance at the end of the stroke.

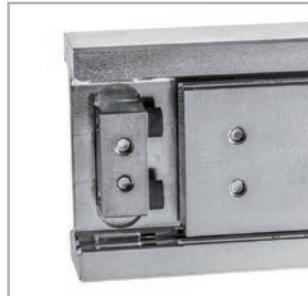

Fig. 59

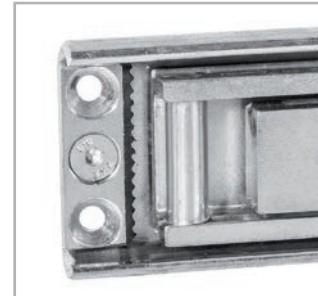

Fig. 60

> Snap

Hegra Rail telescopic guides can be partial with a snap through a ball thrust piece. Thus, an unintended process of the telescope system is avoided.

Note: Not all accessories (interlocks, damping, Drive disk, snap) can be combined with each other and available. (see Technical features overview) Please contact our technical service.

Technical information

> Selecting a suitable telescoping rail

To find a telescoping rail that meets your requirements, the following factors must be considered.

- Desired load capacity
- Available sizes (height, width and rail length)
- Required extension type (partial, full extension, etc.)
- Length of travel
- Desired material and surface

> Mounting tolerances

Installation

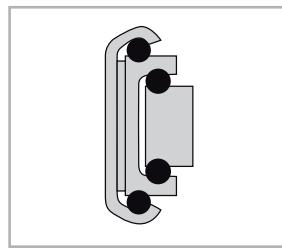

length (mm)	$\geq 150 < 420$	$\geq 420 < 1050$	$\geq 1050 < 2840$
Tolerance (mm)	± 0.5	± 0.8	± 1.2

At the installation, width tolerances of ± 0.5 mm for compensating are to be considered. For all other dimensions, the tolerances according to DIN ISO 2768-1 (m) apply.

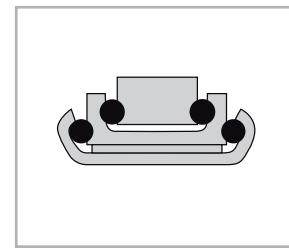

> Load capacity

The specified maximum load capacity always refers to one pair of vertically installed telescoping rails. To achieve this capacity, the following requirements must be fulfilled.

- An absolutely rigid connection construction
- Even distribution of the load over the entire length of the moving rail element
- Mounting of the telescoping rails on a flat and rigid surface using all provided mounting holes
- Please be sure to use the correct screw length to prevent damage to the ball cage: shank length of screw < thickness of the moving element
- Vertical installation of telescoping rails

Vertical installation Fig. 61

Level installation Fig. 62

If optimal implementation of all of these requirements is not possible, we will be glad to assist you in calculating the actual load capacity. In case of a level installation of the telescopic rails (axial load direction), only a reduced value of the radial load capacity is possible.

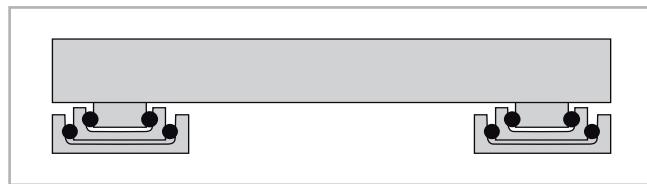

Fig. 63

> Life cycle

The life cycle describes the time span from installation to failure of the telescoping rail, due to wear.

The life cycle is affected by the following factors.

- Load
- Assembly precision
- Parallelism when installed in pairs
- Rigidity of the connection construction
- Jolts and vibrations
- Operating temperature
- Lubrication (in accordance with maintenance intervals)

> Deflection

If the telescopic guides of the HGT series are assembled in pairs and the requirements under "Load capacity" are taken into account, the maximum deflection of steel rails under full load is 1 % of the extended length (stroke). Example: 500 mm length of travel -> max. 5 mm deflection under full load.

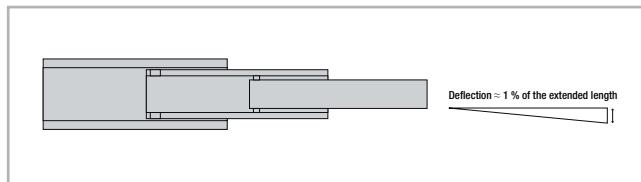

Fig. 64

Note: All other deflection of the Hegra Rail product family on request

> Ball cage displacement

The stroke movement of a telescoping rail is achieved by the ball cages, among other elements. You should ensure that the telescoping rail is always fully extended and retracted, since otherwise the ball cages can become displaced. Ball cage displacement occurs as a result of slippage and means that you can achieve the required extension length and the desired closed condition of the telescoping rail only with increased application of force.

Automated systems must have sufficient reserve driving force or an additional maximum stroke must be planned for in order to prevent displacement.

On request we also implement custom design solutions. Feel free to contact us.

> Operating temperature

The telescoping rails can be used at ambient temperatures from -20 °C to +170 °C (-4 °F to +338 °F). At lower temperatures down to -30 °C (-22 °F) or higher temperatures up to +250 °C (+482 °F), please contact our application engineers. These ranges always require the use of a special lubricant. For temperature above 80°C all plastic parts, if they exist, must be removed

The operating temperature is -20 °C to + 50 °C (-4 °F to + 122 °F) when damping is used.

> Moving force

The moving force is subject to production-related tolerances and is also defined by the load and the deflection of a telescoping rail. Taking into account the load and deflection of a telescoping rail, the closing force is higher than the opening force, since deflection occurs under load and closing takes place by pushing against a slanted plane.

> Corrosion protection

As standard features, all series are zinc electroplated, thick-film passivated and Reach/RoHs compliant. For higher corrosion protection we offer zinc nickel plating with stainless steel balls. Overview of available coatings:

> Lubrication

Alternative lubricants, for example for the food industry, or alternate temperature ranges are available on request. Our aluminium or stainless steel telescoping rails are generally delivered without grease.

Treatment	Characteristics
Thick-film passivation	Standard coating composed of a galvanic zinc coating and an additional passivation
Zinc nickel	Increase corrosion resistance due to a zinc nickel coating and the use of stainless steel ballsyes

Tab. 36

> Maintenance intervals

A visual inspection should be conducted occasionally; foreign particles should be removed and "dry" guide rails should be lightly lubricated with roller bearing grease. This prevents friction, protects the components and prolongs the life of the system. The lubrication intervals are variable and should be determined based on the respective operating conditions such as load, ambient conditions, travel speed, temperature, pollution, etc.

> Mounting instructions

- Please use all mounting holes, in addition to screws of the correct length.
- A stable base is necessary for mounting the telescoping rails.
- In the connection construction, be aware that we have switched to counterbores according to DIN 74 Form F and due to the material thickness of our profiles, the head of the countersunk screw protrudes somewhat from the profile, so that the mating piece must have a corresponding counterbore.

Telerace

NEW

New Telerace

Telescopic rail with double row ball bearings.

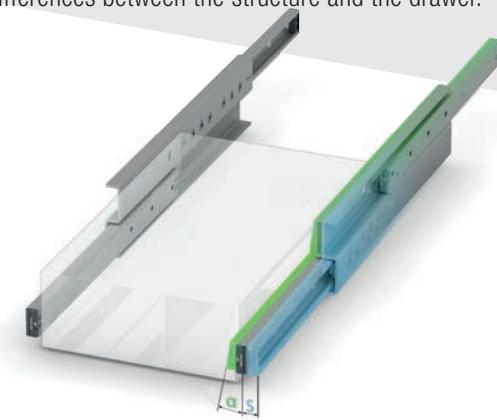

It simplifies and improves automations: **7 main advantages**.

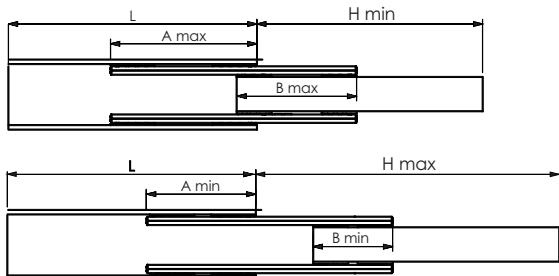

1

Unique features: self-alignment and stroke customization

TLR: self-aligning version compensates dimensional differences between the structure and the drawer.

TLQ: Easy set the stroke length required by adjusting the distance of the sliders in the rail.

2

Ideal for automation

The use of ball bearings and robust end-stoppers allows to handle high dynamics and reduce cycle times.

3

Reliable vertical and variable stroke

The absence of the ball cage allows to perform automated vertical and variable strokes.

4

Low opening and closing force

Low deflection with sturdy profiles.

Ground raceways for a smooth and silent movement with low friction.

A full range of telescopic rails for your automations

Also available with single row ball bearings and rolled steel profiles hardened with Rollon-Nox treatment or made of stainless steel.

5

Optimal reliability in dirty environments

Large rolling elements make Telerace less sensitive to dirt and debris.

End-stoppers feature wipers with slow release felts for an optimal cleaning and constant lubrication of the raceways.

6

Long lifetime

Different hardening treatments according to the rail type and size.

- **Induction hardening:** hardened raceways with 1.2 mm effective depth and hardness between 58 and 62 HRC.
- **Rollon-Nox hardening:** treatment of deep nitriding and black oxidation.

7

Resistant to corrosion

Different surface treatments make Telerace reliable in harsh environments.

- **Indoor applications:** Zinc-plating ISO 2081.
- **Corrosive environments (humidity):** ZincNickel-plating ISO19598.
- **Corrosive environments (acidic or basic):** nickel-plating.

Product explanation

➤ Telescopic rails with rollers designed for industrial automations.

Fig. 1

Telerace family is composed of telescopic rails with ball bearings. These rolling elements make the product less sensitive to high dynamics or shifting working cycles that are typical for automation. Telerace rails are therefore ideal for automated applications where high number of cycles, long service requirements and low maintenance are essentials. In addition, the absence of the ball cage contributes to make Telerace the ideal choice for vertical or variable stroke applications and whenever the rail must function in presence of dirt and debris.

The rails come in six series. It is possible to choose between double row and single row ball bearings, different geometries, sizes and materials to perfectly fit the project and improve the productivity to various kinds of telescopic applications. Each series is designed and equipped to meet specific requirements not only in terms of loads, lifetime and environment but also regarding project simplification and modularity of the solution.

The listed load capacities are per pair of rails, with the load centered. In case the load is not centered, the load capacity is reduced.

The most important characteristics:

- Compensation of minor misalignment errors (TLR...AP)
- Customizable stroke/load capacity ratio (TLQ...P, TQN...P, TQAX).
- Ideal in dirty environments due to large rolling elements
- Ideal for automated applications, vertical and variable stroke
- Different anticorrosion treatments available
- High load capacity
- High operating speeds
- Wide temperature range

Preferred areas of application:

- Automation
- Material handling
- Industrial machines
- Medical technology
- Packaging machines
- Construction and machine technology (doors, protective covers)
- Robots and manipulators

TLR...P 

Fully extending telescopic rails with double row ball bearings and rigid S-shaped intermediate element. They feature high load capacity, low deflection in extended state and a smooth motion without clearance. A special self-aligning version is available for compensating minor misalignments of the structure. Size 18 is hardened with Rollon-Nox nitriding and oxidation process that provides it with a fine black color. Size 28 and 43 have induction hardened and fine ground raceways with different anticorrosion treatments available.

Fig. 2

TLQ...P 

Telescopic rails with double row ball bearings and compact square cross-section. This combination allows high axial and radial load capacity with low overall dimensions and weight, making them particularly suitable for vertical applications. It is possible to customize the stroke/load capacity ratio by adjusting the distance between the sliders in the rail.

Size 18 is hardened with Rollon-Nox nitriding and oxidation process that provides it with a fine black color. Size 28 and 43 have induction hardened and fine ground raceways with different anticorrosion treatments available.

Fig. 3

TLN...P

Fully extending telescopic rails with single row ball bearings and rigid S-shaped intermediate element. They are designed to achieve smooth movement, high load capacity and low deflection while maintaining a cost-effective structure.

They are hardened with Rollon-Nox nitriding and black oxidation process.

Fig. 4

TQN...P

Telescopic rails with single row ball bearings and compact square cross section. They are particularly suitable for vertical applications and designed to achieve smooth movement, high load capacity and low deflection while maintaining a cost-effective structure. It is possible to customize the stroke/load capacity ratio by adjusting the distance between the sliders in the rail.

They are hardened with Rollon-Nox nitriding and black oxidation process.

Fig. 5

TLAX

Telescopic rails made of stainless steel AISI 304 with AISI 440 hardened steel rollers with 2RS seals and lubricated for life with grease for longevity and low temperature applications. They are ideal for pharmaceutical, chemical, medical industries or marine environment. For very severe environmental conditions, they can be supplied in electro-polished version for a further improved corrosion resistance.

Fig. 6

TQAX

Compact telescopic rails made of stainless steel AISI 304 with AISI 440 hardened steel rollers with 2RS seals and lubricated for life with grease for longevity and low temperature applications. They are particularly suitable for vertical applications and pharmaceutical, chemical, medical industries or marine environment. It is possible to customize the stroke/load capacity ratio by adjusting the distance between the sliders in the rail. For very severe environmental conditions, they can be supplied in electro-polished version for a further improved corrosion resistance.

Fig. 7

Rollers

TLR...P and TLQ...P telescopic rails feature double row ball bearings to provide high load capacities in both radial and axial direction and are equipped with splash-proof plastic seal (2RS). The rollers have two contact points on each raceway, creating a well constrained movement in both radial and axial direction. The self-aligning version TLR...AP features a combination of guiding and floating rollers. The floating rollers are constrained radially but allowed to float in the axial direction between the two shoulders and to rotate a little.

Fig. 8

TLN...P, TLQ...P, TLAX and TQAX telescopic rails feature single row ball bearings made of hardened steel or stainless steel and lubricated for life.

Technical data

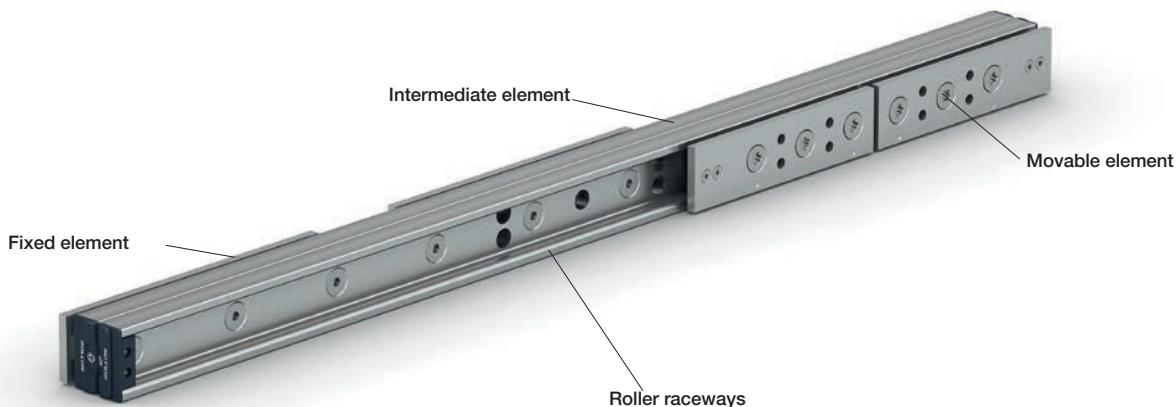

Fig. 24

Performance characteristics:

TLR...P and TLQ...P **PLUS**

- Available sizes: 18, 28, 43
- Max. operating speed: 1 m/s (depending on application and stroke)
- Max. operating temperature: -20° C to + 110° C (-4° F to 230° F).
- Rail material: cold-drawn carbon steel CF53 (size 28-43), cold-drawn carbon steel 20MnCr5 (size 18) Fe P02G for intermediate element.
- Surface treatment: zinc-plated ISO 2081 with induction hardened and ground raceways (size 28-43), hardened with Rollon-Nox treatment (size 18)
- Rollers material: steel 100Cr6 (also available stainless steel AISI 440)
- Roller seal/shield: 2RS (splash-proof)

Remarks

- All load capacity data are based on a pair of telescopic rails, except the value Mx of TLQ...P, TQN...P and TQAX series.
- All load capacity data is based on continuous operation
- Internal stops are used to stop the unloaded slider and the rollers.
Please use external stops as end stops for a loaded system
- TLR...P, TLN...P and TLAX must be mounted with upper rail fixed to structure and the lower rail fixed to the moving part.
- Custom strokes on request.
- For TLR...P, TLN...P series please observe right or left side use.
- Fixing screws of property class 10.9 must be used for all telescopic rails.

TLN...P and TQN...P

- Available sizes: 30, 40
- Max. operating speed: 1 m/s (depending on application and stroke)
- Max. operating temperature: -20° C to + 80° C (-4° F to 176° F)
- Rail material: S420MC for rails, Fe P02 for TLN...P intermediate element, S235JRG2 for TLQ...P sliders
- Surface treatment: hardened with Rollon-Nox process
- Rollers material: carbon steel with Z2 shield (dust cover seal)

TLAX and TQAX

- Available sizes: 26,40
- Max. operating speed: 1 m/s (depending on application and stroke)
- Max. operating temperature:-20 °C to +80 °C (-4° F to 176° F)
- Rail material: stainless steel AISI 304
- Rollers material: stainless steel AISI 440 with 2RS shield (splashproof seal)

Tab. 18

Technical instructions

> Telescopic rail selection

Selecting the suitable telescopic rail should be done based on the load and the maximum permissible deflection in the extended state. The load capacity of a Telerace telescopic rail depends on two factors: the load capacity of the rollers and the rigidity of the intermediate element. For

mainly short strokes the load capacity is determined by the load-bearing capacity of the rollers; for average and long strokes it is determined by the rigidity of the intermediate element.

> Deflection

If the load P acts vertically on the pair of rails (see fig. 42), the expected elastic deflection in the extended state can be determined as follows:

$$f = \frac{q}{t} \cdot P$$

Fig. 41

Whereby:

f is the expected elastic deflection [mm]

q is a stroke coefficient (see fig. 44)

t is a factor depending on the model of the telescopic rail (see fig. 43)

P is the actual load acting on the centre of a pair of rails [N].

The value resulting from the formula above is an estimation and also assumes an absolutely rigid adjacent construction. If this rigidity is not present, or in case the deflection is a key application requirement, please contact our Technical Department for a precise calculation.

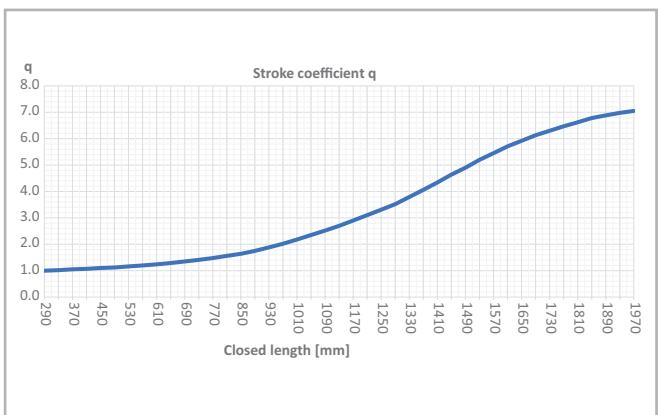

Fig. 44

> Sizing of telescopic applications

The main factors to consider while sizing the rail for a telescopic movement are:

- Weight of the mobile part and other applicable loads
- Presence of dynamic forces / eventual abuse
- Max. acceptable deflection
- Max. acceptable extraction/closing force of mobile part
- Environment, frequency and speed
- Expected lifetime

All load capacities C_{Orad} are indicated per pair of rails and with the load perfectly centered. Hereby the load P is acting as a radial point load, at half the extension and in the middle between the two rails. The load capacity for a single rail is obtained dividing the value C_{Orad} by half.

When sizing a telescopic application, consider the center of mass of the load and any external dynamic forces acting on the rails.

In case the actual load P isn't centered the equivalent load P_e must be calculated for the verification of load capacity explained on page TL-22.

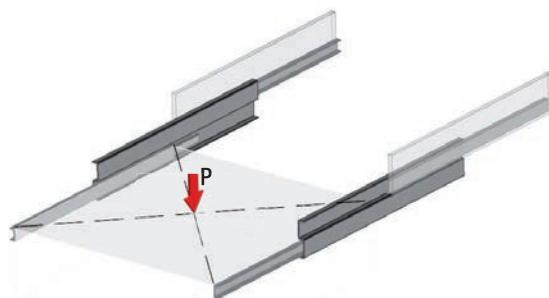

Fig. 47

$$P_e = 2 \cdot \frac{P \cdot d}{a + b} \cdot \frac{1}{f_p}$$

Fig. 45

Where :

P = Weight/load of mobile part [N]

a, b = distances of the load center with respect to left and right rail [mm].

d = the largest between "a" and "b", according to the load position [N].

f_p = Load position coefficient, based on relation between the value "c" (distance between actual load P and load C_{Orad}) and stroke H . The coefficient f_p is obtained from diagram in Fig. 49.

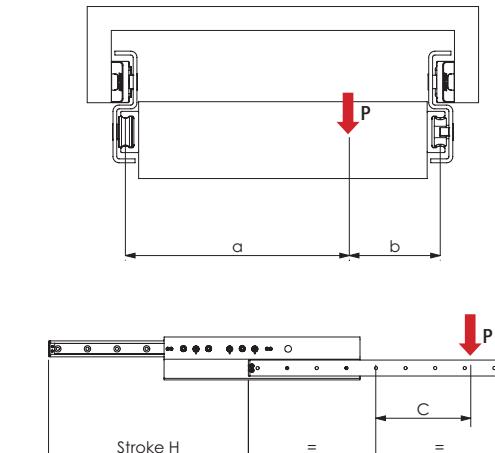

Fig. 48

Load capacity reduction according to the position of the load P

For a single rail, P_e is obtained with the following formula:

$$P_e = \frac{P}{f_p}$$

Fig. 46

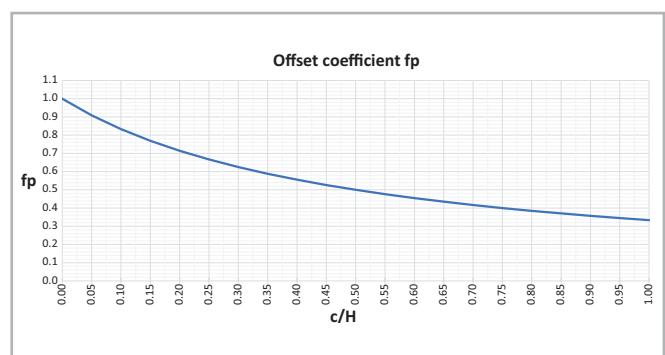

Fig. 49

> Verification of load capacity

Verification of the load capacity assumes the knowledge of the forces acting on the rails in the different directions, divided into principal components correspondent to the values indicated in the tables of the product pages: radial loads, axial loads and moments.

For the telescopic rails with intermediate element TLR...P, TLN...P and TLAX the verification is mainly down to comparing the load capacity C_{0rad} to P_e , including a safety factor S_0 .

$$P_e \leq C_{0rad} / S_0$$

Fig. 50

Where S_0 is the safety coefficient as per below table

Safety coefficient - S_0	Application conditions
1 - 1.5	Neither shocks nor vibrations, smooth and low-frequency reverse, high assembly accuracy, no elastic deformations
1.5 - 2	Normal installation conditions
2 - 3.5	Shocks and vibrations, high-frequency reverse, significant elastic deformation

Tab. 19

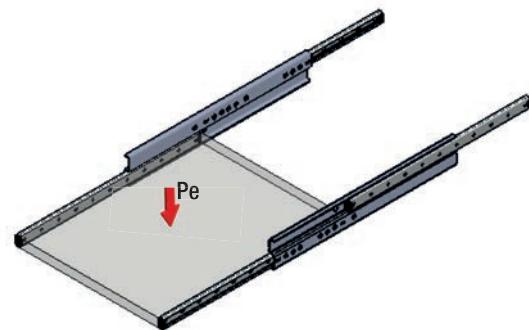

Fig. 52

For telescopic rails TLQ...P, TQN...P and TQAX the calculation might also includes moments and axial load.

$$\left(\frac{P_{e_{ax}}}{C_{0ax}} + \frac{P_{e_{rad}}}{C_{0rad}} + \frac{M_{e_x}}{M_x} + \frac{M_{e_y}}{M_y} + \frac{M_{e_z}}{M_z} \right) \leq \frac{1}{S_0}$$

Fig. 51

Where:

$P_{e_{rad}}$ = applied radial load

$P_{e_{ax}}$ = applied axial load

M_{e_x} , M_{e_y} , M_{e_z} = applied moments

C_{0rad} = radial load capacity

C_{0ax} = axial load capacity

M_x , M_y , M_z = moment capacities

* M_{e_x} moment exist only in case of use a single telescopic rail

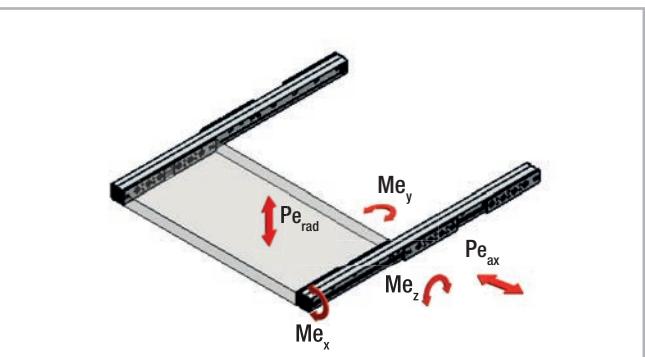

Fig. 53

If using a single telescopic rail, the values C_{0rad} , C_{0ax} , M_y and M_z in the formula Fig. 51 must be divided by 2 (M_x is always and only referred to a single rail).

> Lifetime calculation

The service life is defined as the time span between commissioning and the first sign of fatigue or wear indications on the raceways. The service life of a telescopic rail is dependent on several factors, such as the effective load, the installation precision, occurring shocks and vibrations, the operating temperature, the ambient conditions and the lubrication.

Calculation of the service life is based exclusively on the loaded ball bearings. In practice, the decommissioning of the bearing, due to its destruction or extreme wear of a component, represents the end of service life.

This is taken into account by an application coefficient (f_i in the formula below), so the service life consists of:

$L_{cy} = 50 \cdot \left(\frac{C}{P_e} \cdot \frac{1}{f_i} \right)^3 \cdot \frac{1}{H} \cdot 10^6$ $L_{km} = 100 \cdot \left(\frac{C}{P_e} \cdot \frac{1}{f_i} \right)^3$	L_{cy} = calculated service life [num. of cycles] L_{km} = calculated service life [Km] C = Dynamic load coefficient P_e = Equivalent load applied [N] H = Stroke [mm] f_i = Application coefficient
---	---

Fig. 54

Application coefficient f_i

The correction factor f_i applied to the theoretical calculation formula has the sole purpose of guiding the designer quantitatively on the influence in the lifetime estimation of the real application conditions without any pretense of precision. For more details please contact our technical department.

Coefficient f_i	Operating conditions
1 - 1.5	Correct load sizing, rigid structures, routine lubrication, clean ambient
1.5 - 2	Intermediate conditions
2 - 3.5	Approximative load sizing, unprecise non rigid structures, dusty not clear ambient.

Tab. 20

Equivalent load applied P_e

When the load P is not perfectly centered, the equivalent load P_e must be calculated as shown in Fig. 45, otherwise, with the load perfectly centered:

$$P_e = P_{rad}$$

Fig. 55

When using a pair of telescopic rails series TLQ, TQN and TQAX, in presence of simultaneous load P_{rad} , P_{ax} and moments M_y , M_z (M_x only in case of single rail) :

$$P_e = C_{0rad} \cdot \left(\frac{P_{e_{rad}}}{C_{0rad}} + \frac{P_{e_{ax}}}{C_{0ax}} + \frac{M_{e_x}}{M_x} + \frac{M_{e_y}}{M_y} + \frac{M_{e_z}}{M_z} \right)$$

Fig. 56

If using a single telescopic rail, the values C_{0rad} , C_{0ax} , M_y and M_z in the formula Fig. 57 must be divided by 2 (M_x is always and only referred to a single rail).

> Opening and closing force

For applications requiring very low opening and closing forces, the rails series TLR...P and TLQ...P are recommended. The required force F_e to extend a pair of rails is determined by the friction of the rolling elements and the applied load P , according to the following formula:

$$F_e \approx k + 0.01 \cdot P$$

Fig. 57

The required force F_c to close a pair of rails is also influenced by the deflection and the stroke, according the the following formula:

$$F_c \sim k + 0.01 \cdot P + 1.5 \cdot \frac{f}{H} \cdot P$$

Fig. 58

Where :

P = radial load applied on the pair of rails

f = calculated deflection

H = stroke

k = friction force per pair of telescopic rails connected without load applied

These calculated values may be influenced by some additionnal binding friction from non precise assembly or structure. For a single rail, the same formulas can be used.

TLR18P / TLQ18P	$k=10\text{ N}$
TLR28P / TLQ28P	$k=15\text{ N}$
TLR43P / TLQ43P	$k=25\text{ N}$

Fig. 59

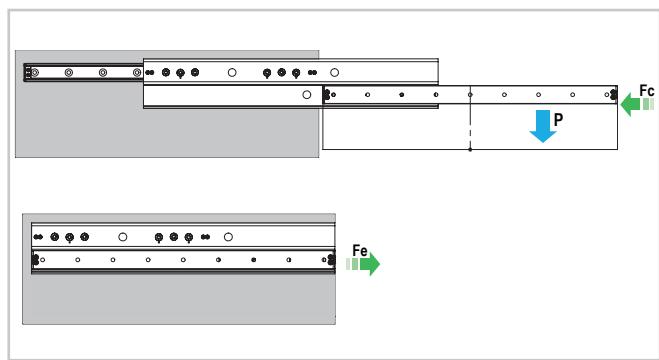

Fig. 60

> Lubrication

TLR...P and TLQ...P rails are equipped with internal wipers with slow release felts that ensure a proper lubrication of the raceways for all the product's lifetime if the rail is used in indoor, clean, environments. The rollers are also lubricated for life. If used in harsh environments (eg. dirt, temperature, humidity) it is necessary to periodically clean and lubricate the raceways.

TLN...P, TQN...P, TLAX and TQAX rails only feature rollers lubricated for life. The raceways must therefore be lubricated every 100.000 cycles if they are used in indoor, clean, environments. If used in harsh environments (eg. dirt, temperature, humidity) the lubrication interval must be reduced and it is necessary to periodically clean the raceways.

Raceways are lubricated with a lithium lubricant of average consistency (roller bearing lubricant). Different lubricants are available on request for special applications:

- FDA-approved lubricant for use in the food industry
- specific lubricant for clean rooms
- specific lubricant for the marine technology sector
- specific lubricant for high and low temperatures

For more details please contact our technical department.

> Anticorrosion treatments

TLR...P / TLQ...P

Treatment	Characteristics
Rollon-Nox	Patented high depth nitride hardening and black oxidation treatment that provides good durability under high loads or frequencies. It is standard for size 18 and it's not available for other sizes.
Zinc Plating ISO 2081	Standard treatment for rails sizes 28-43, it is ideal for indoor applications. It is removed from the raceways by the subsequent grinding process. Zinc-plated telescopic rails are supplied with steel rollers.
ZincNickel ISO19598 (Z)	Ideal for outdoor applications. Telescopic rails with this treatment are supplied with stainless steel rollers to further increase the corrosion resistance.
Rollon E-coating (K)	Electro painting that provides a fine black finishing to the entire rail. It can be partially removed from the raceways on the running contact point of the rollers after a period of use. Telescopic rails with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.
Nickel Plating (N)	Provides high resistance to chemical corrosion and is ideal for applications in medical or food related environments. Raceways are coated too. Telescopic rails with Nickel Plating treatment are supplied with stainless steel rollers to further increase the corrosion resistance.

Tab. 21

TLN...P / TQN...P

Treatment	Characteristics
Rollon-Nox	Patented high depth nitride hardening and black oxidation treatment that provides good durability under high loads or frequencies and good corrosion resistance. It is standard for all sizes.
Rollon E-coating (K)	Electro painting that provides a fine black finishing to the entire rail. It can be partially removed from the raceways on the running contact point of the rollers after a period of use. Telescopic rails with Rollon E-Coating are supplied with stainless steel rollers to further increase the corrosion resistance.

Tab. 22

TLAX / TQAX

As standard, TLAX and TQAX feature rails and intermediate S-element in AISI304 and Rollers in hardened AISI440.

Treatment	Characteristics
Electro-polish (X)	Rails and intermediate element are completely electro-polished for further improved corrosion resistance. The electro-polishing treatment also gives the product a very shiny surface.

Tab. 23

> Speed

The speed of the rails is limited by the strength of the stoppers that take on the intermediate element with each opening/closing. At the same speed, the impact force increase proportionally to the length of the rail and the weight of the intermediate element.

All Telerace telescopic rails feature robust end-stoppers capable of sustaining high speeds. Besides highest speed, the telescopic rails with ball bearing rollers are also less sensitive to frequent and intense accelerations and decelerations due to absence of the ball cage.

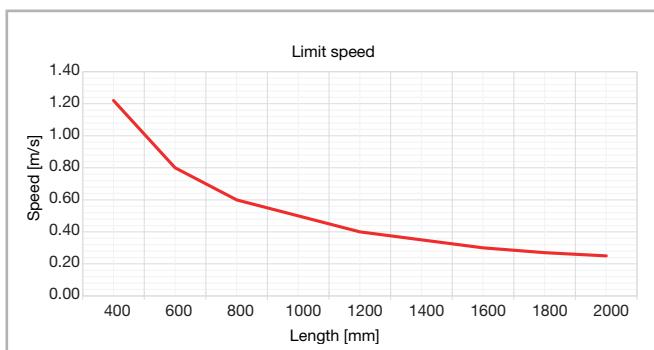

Fig. 61

► Self-aligning system with TLR...AP

TLR...P telescopic rails are also available in the TLR...AP version that allows a slight rotation of the movable element around the longitudinal axis, with respect to the fixed element. This rotation is obtained by using a combination of floating and guiding rollers and allows the rail to adapt to mounting surfaces that are not perfectly aligned in their frontal part, avoiding the overload of the rollers and the deterioration of the motion quality. This same rotation also permits a slight compensation of an eventual dimensional gap between the fixed and mobile structures, that may occur due to manufacturing tolerances, with respect to the nominal dimensions of the rail.

Below are listed 3 examples of compensation of structural errors:

A) Maximum angular compensation (α_1) of misaligned mounting surfaces of the mobile structure.

The compensating rail TLR...AP must be used in pair with a guiding rail TLR...P to ensure the perfect operation of the system and an optimal lateral stability.

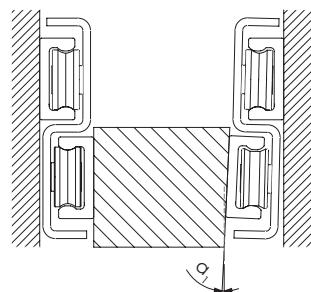

Fig. 62

B) Maximum angular compensation (α_2) of misaligned mounting surfaces of the fixed structure

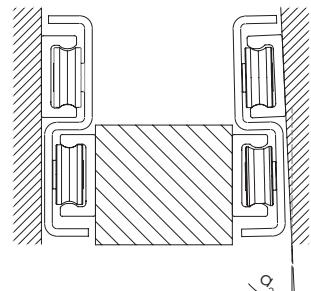

Fig. 63

C) Maximum linear compensation (B) of the dimensional gap between mobile and fixed structure for a rail with parallel mounting surfaces.

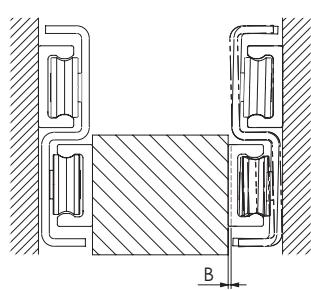

Fig. 64

Size	α_1 [°]	α_2 [°]	B [mm]
18	1	1	0.3
28	0.85	0.85	0.3
43	1.3	1.3	0.5

> Stroke customization for TLQ...P, TQN...P, TQAX

TLQ...P, TQN...P and TQAX series offer the unique possibility to easily customize the actual stroke H to individual needs. This is obtained by repositioning the slider distance "A" for "Fixed sliders" and distance "B" for "Mobile sliders", with different distances than standard. Please consider that distance A should always be longer than distance B to maximize the load capacity. If the distance between fixed sliders "A" and mobile sliders "B" is reduced the total stroke increases and the load capacity decreases. Viceversa, the total stroke decreases and the load capacity is improved. Please contact our technical department for load capacities according to customized stroke.

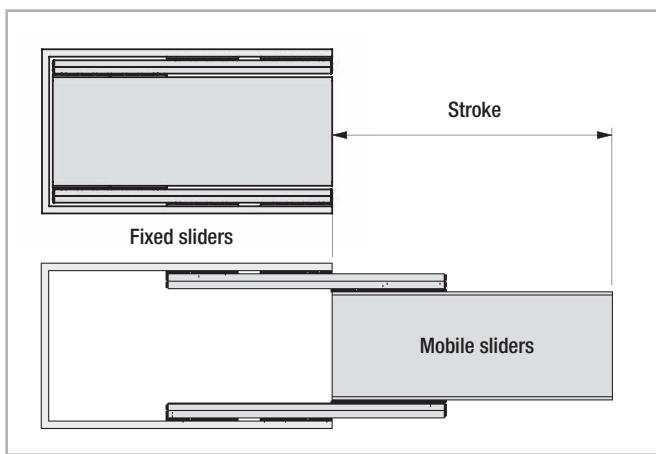

Fig. 65

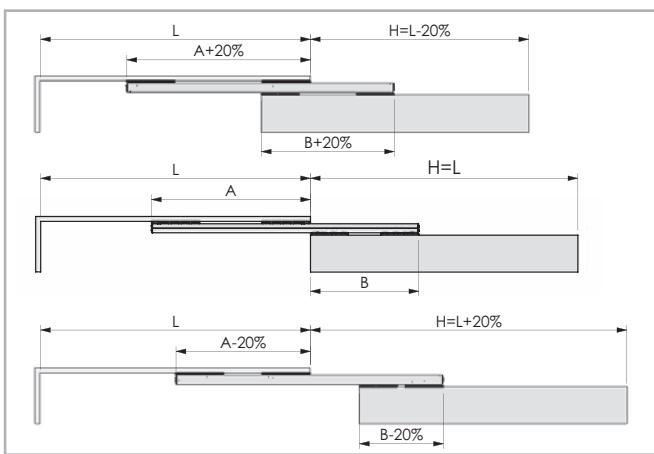

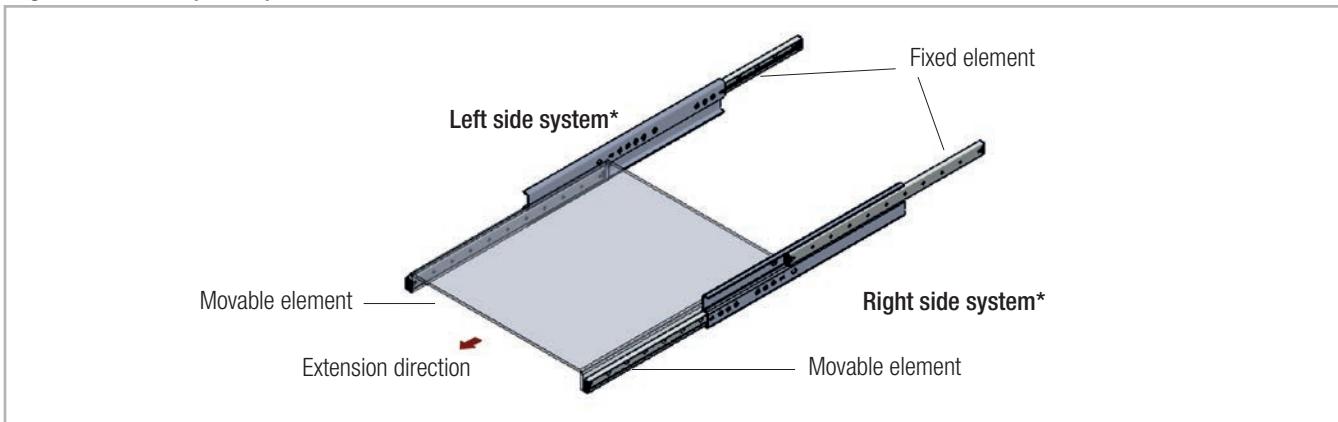

Fig. 66

> Installation instructions

In general and for specific product series

* For model TLR...P and TLN...P please observe right or left side use.

Fig. 67

General

- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the telescopic rails with all accessible holes on a rigid and level surface.
- Please observe the parallelism of the installation surfaces. The fixed and movable rails must be fit to a rigid assembly construction.
- Telerace rails are suitable for continuous use in automatic systems, even when the stroke is not constant.

The operating speed must be checked (see pag. TL-26).

TLR...P, TLN...P, TLAX

- This series accept radial loads. This should act in the vertical cross-sectional axis on the movable rails.
- Horizontal and vertical application is possible. Prior to vertical installation, please contact our technical department.
- When installing make sure that the load is placed on the movable element (the lower rail) (see fig. 67). The opposite assembly negatively affects the function.
- Installation must be done on a rigid structure using all accessible fixing holes.
- Pay attention to the parallel alignment during assembly with paired application. It is possible to compensate minor misalignment errors by pairing TLR...P with TLR...AP (see pag. TL-27)

TLQ...P, TQN...P, TQAX

- This series accept radial and axial loads and moments in all principal directions.
- Horizontal and vertical applications are possible. Prior to vertical installation, please contact our technical department.
- The rail must be installed with the label facing upward. The fixed sliders have the circular engraving mark facing upward, while on the mobile sliders the same mark is facing downward.
- When used in pairs, the same rail can be used as left or right rail, always keeping the mark facing upwards.

Notes

TL

Light Rail

New Light Rail

A renewed range of rolled steel telescopic rails with light structure and full or partial extension: **4 main advantages.**

1

Low deflection

Good rigidity in relation
to a lightweight design

2

Quiet sliding

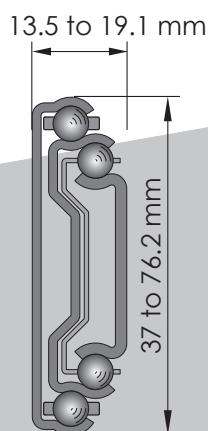

Smooth and silent movement
with heavy loads.

3

Low maintenance

Lubricated with heavy duty ball bearing grease based on mineral oil.

4

Space saving

Compact overall dimensions make them ideal for medium and lightweight drawers.

Structural elasticity capable of absorbing minor impacts.

Product explanation

> Light telescopic rails with full or partial extension

Fig. 1

Light Rail is the product family of lightweight telescopic rails with full and partial extension, ideal for applications in which the mass of the rail is just as important as the bending rigidity.

End stoppers allow smooth and quiet operation even with heavy loads applied and avoid permanent distortion in case of eventual shocks.

Different options are available depending on the rail size (e.g. locking systems in open and/or closed position) and further customizations (e.g. lengths, strokes) are possible.

The Light Rail product family is available in 5 sizes (37-46-56-71-76) and features partial or full extension, with a wide range of use that spans from light-duty applications, such as kitchen drawers or office furniture, to more demanding ones in industrial automations or special vehicles.

The most important characteristics:

- Light and quiet running
- Long service life with low maintenance
- High reliability
- Structural elasticity capable of absorbing minor impacts and absence of permanent deformation
- Not sensitive to side impacts

Preferred areas of application:

- Beverage industry
- Automotive
- Construction and machine technology (e.g., housing)
- Packaging machines
- Railcars (e. g., maintenance and battery extensions)
- Special machines

LRS 37

Partial extension telescopic rail made of cold rolled, low carbon steel, interconnected with a ball bearing cage and treated with corrosion resisting zinc-plating ISO 2081 with blue passivation. It features end stoppers which reduce noise function, and is ideal for light-duty applications such as kitchen and bathroom drawers as well as office furniture.

Fig. 2

LFS 46

Full extension telescopic rail with detachable internal element, which can be released with a latch. Rails are made of steel, the ball cages of steel and plastic. Roll back protection in closed position.

Fig. 3

LRS 56 - 71

Full extension telescopic rail made of cold rolled, low carbon steel rails interconnected with ball bearing cages and treated with corrosion resisting zinc-plating ISO 2081 with blue passivation. It features end stoppers with hold closed which reduces noise function and prevents the guide from opening by itself in closed position.

Fig. 4

LRS 76

Technical data

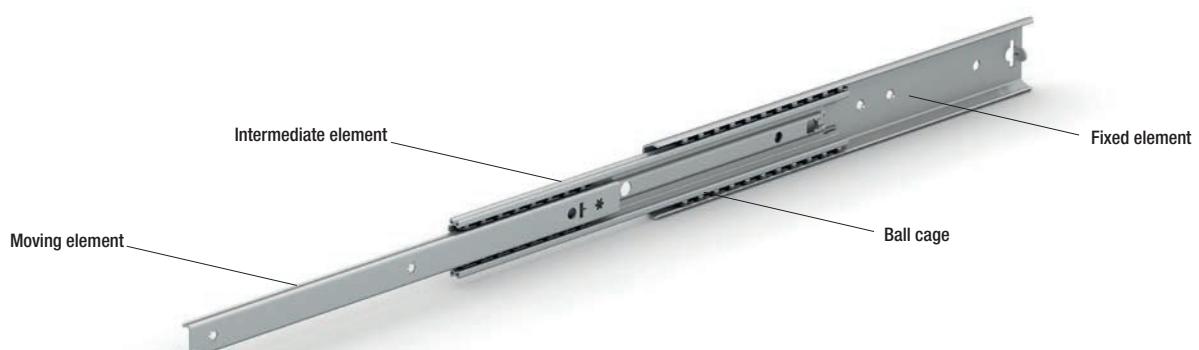

Fig. 11

Performance characteristics:

- Extension speed (depending on application):
 - Extension 100 - 500 mm: max. 0.5 m/s (19.69 in/s)
 - Extension 600 mm: max. 0.4 m/s (15.75 in/s)
 - Extension \geq 700 mm: max. 0.3 m/s (11.81 in/s)
- Temperature range: LRS from -20°C to +80°C (depending on the application), LFS from +10°C to +40°C (depending on the application).
- All systems are lubricated with heavy duty ball bearing grease based on mineral oil.
- Rail material: cold rolled, low carbon and high yield strength steel.
- Ball cages material: electrologically galvanized steel or plastics.
- Ball bearings material: hardened carbon steel.

Remarks:

- All load capacity data are based on a pair of telescopic rails
- Horizontal movement installation is recommended
- All strokes are subject to a general tolerance of \pm 4 mm.
- Vertical movement installation on request, please contact our Technical Department.
- Assembly in cross-sectional width, here a positive tolerance of +0.5 mm is recommended (mounted under tension). If the extensions are installed with too small tolerances, the service life is decreased
- Cycle data applies to the use of an extension pair (recommended)
- Vertical use of extensions (radial load) is recommended
- Not suitable for moments – must be used in pair
- For alternative and specialized finishings, please contact our technical department.
- Customizations possible (eg. lengths, strokes, hold-in, soft close bumpers, ...). Please contact our technical department.
- The existing internal stops are not designed to stop the moving load. They are only supposed to retain the ball-cage and prevent the internal parts to slide out of the assembly. An external end-stop must always be installed to stop the moving load.

Tab. 5

Note: The given load capacities are guidelines with uniform load distribution (area load) when using all mounting holes (at least one hole for each group must be used). The load values must be reduced in unfavorable conditions.

Technical instructions

> Load capacities

Vertical installation (radial load)

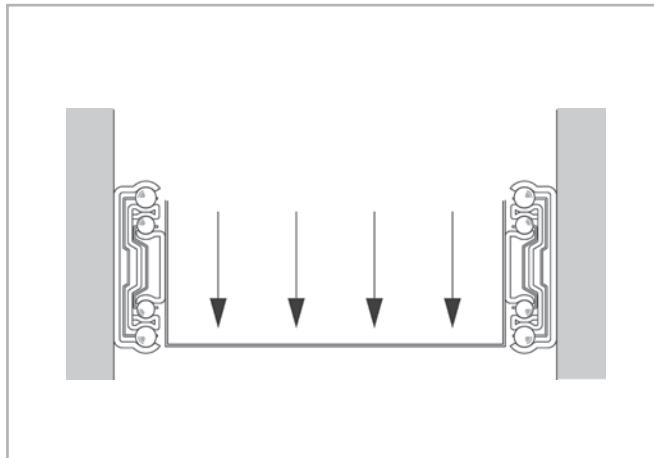

Fig. 17

The given loading capacities are guidelines for a pair of rails vertically mounted with uniform load distribution using all mounting holes (for LFS46 and LRS76 at least one hole of each group must be used). The load values must be reduced in unfavorable conditions.

> Overall dimension

When installing the rail, its nominal overall dimension relative to the side of the drawer/cabinet must be kept in mind. The overall dimension is the thickness of the rail plus $0.5 \text{ mm} \pm 0.25$. The thickness of the rail is measured with the ball cage in the closed position. Be sure to leave at least 5 mm of clearance behind the drawer.

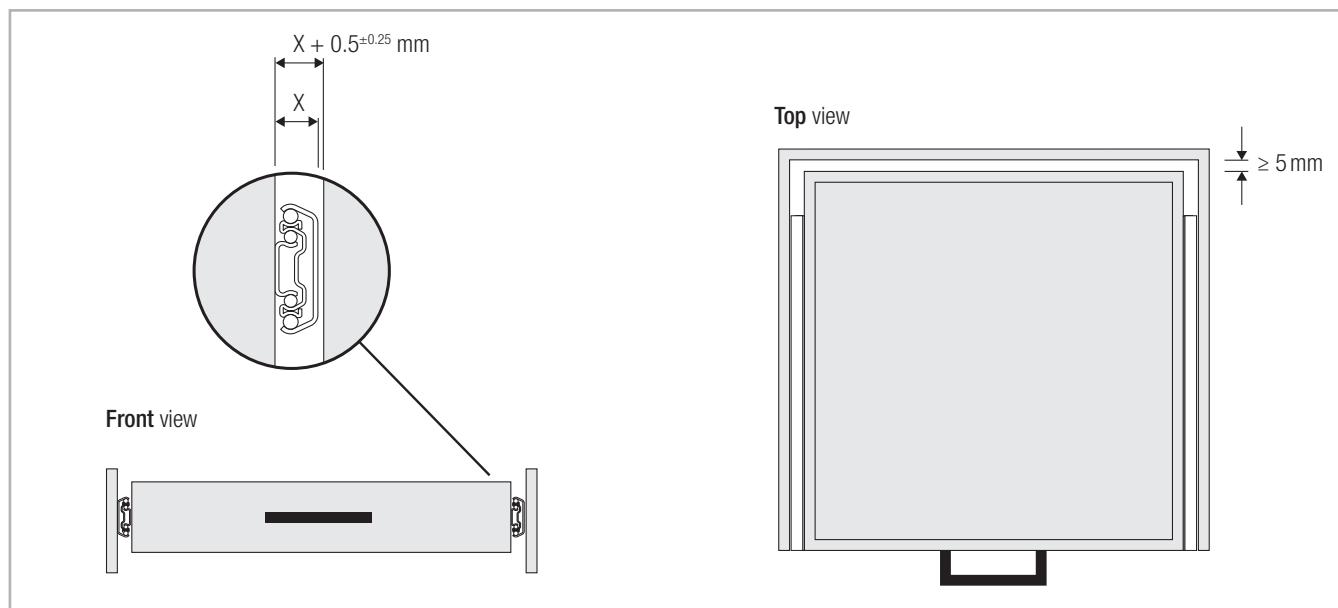

Fig. 18

> Alignment

When positioning the rails, it is important that they are aligned accurately, within the specified tolerances. The more precisely the guide rails are aligned, the smaller the chance that they will work against each other.

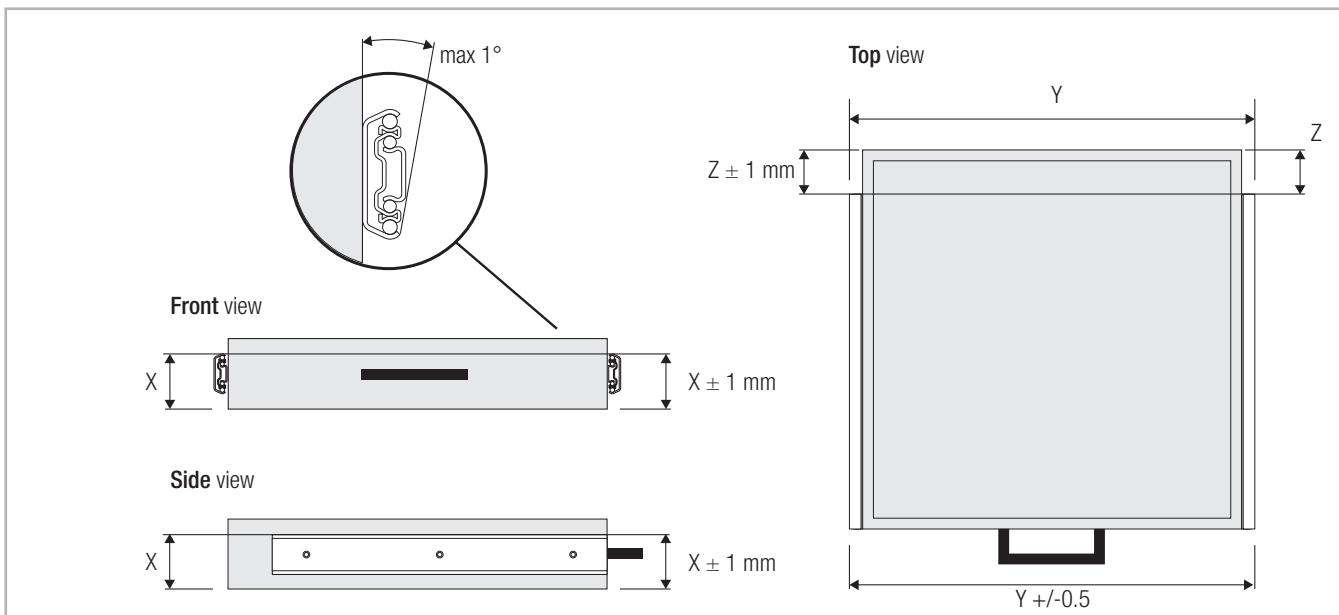

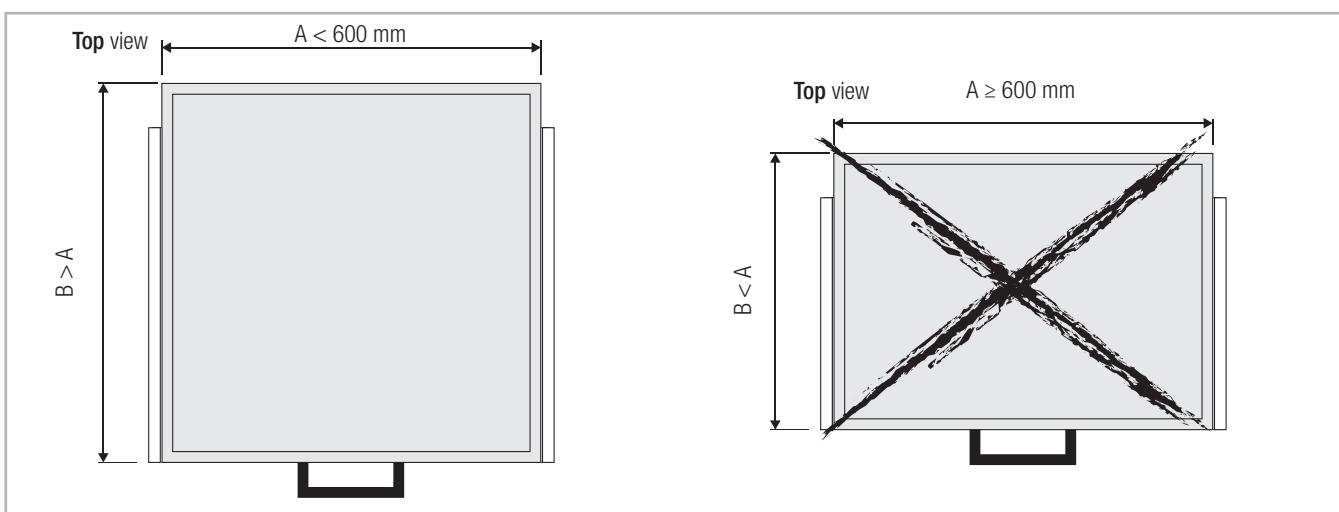

Fig. 19

> Stroke tolerance

The given strokes in the „Dimensions and load capacity“ chapter are subject to a general tolerance of ± 4 mm.

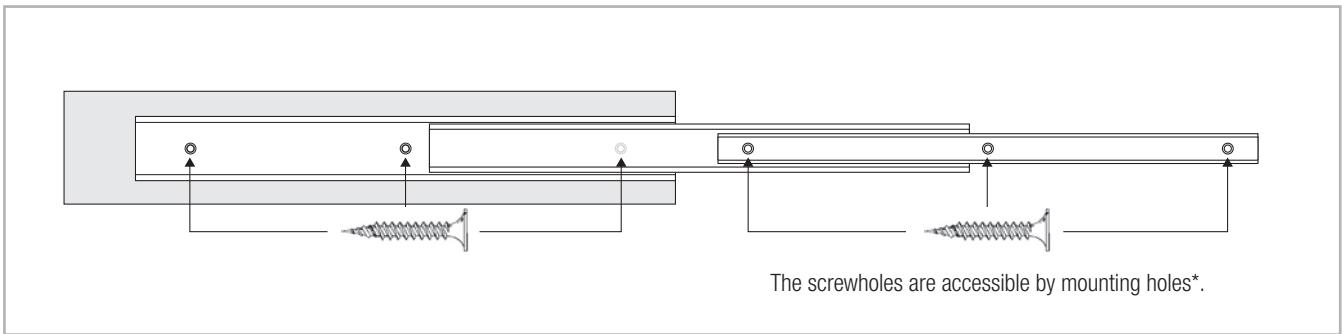

> Distances

The pair of rails are tested at a maximum width of 600 mm. For distances wider than 600 mm, please contact our technical department.

> Fixations

The rails can be mounted using a wide variety of fixations such as screw holes, mounting tabs, hanging tabs, press-in bolts, etc. When selecting screws, make sure the screw head does not protrude, so there is no contact between the moving parts of the rail and the screw head.

*the number of screws may vary depending on the length of the rail

Fig. 21

Type	Size	Screw type	
		Moving element	Fixed element
LRS	37	Metal: M4 / DIN 965 / ISO 7046 M4 / DIN 7500 Wood: 4,5 / DIN 7997	Metal: M4 / DIN 7984 M4 / M5 / ISO 7380 Wood: 5,0 / DIN 7997

Tab. 6

> Load capacity

Load capacities are specified per pair and are purely indicative. Length, application and construction of the enclosure all have an impact on the load capacity. We recommend testing based on a prototype of the final application. Only then can the proper operation, service life and safety of the application be ensured.

Static load capacity

Static load means that the load capacity of the rail is based on less than 10.000 cycles per pair.

Dynamic load capacity

Dynamic load means that the load capacity of the rail is based up to 100.000 cycles per pair (50.000 for LFS46 and LRS76). The number of cycles affects the service life and performance. Other factors that may affect performance are:

1. A uniformly or unevenly distributed load
2. Centre of gravity of the load
3. The speed and/or frequency of the movement
4. The length of the rail relative to the extended length
5. The force with which the load comes against the end stop
6. For optimum performance, the rails must be regularly fully extended
7. In case of use in outdoor applications or aggressive environments, please contact our Technical Department.

> Abnormal loads / vibrations

Transport, misuse and shock loads – even of short duration – may cause damage. Excessive or continuous vibration can also reduce the performance and service life of the rails.

> Anticorrosion treatments

The rails have a corrosion-resistant, zinc-plated, blue-passivated finish. High humidity, salts or other chemical agents may damage the surface of metal or plastic components. Exposure to any such conditions should be avoided at all times. For more information please contact Rollon technical support.

> Lubrication

To ensure optimum performance, Rollon applies grease/lubricant to the rails. Contaminants such as grime, grindings, sawdust, paint, etc. may reduce the effectiveness of the applied grease. For more information please contact our Technical Department.

> Speed

The extension speed is determined by the size of the intermediate elements. Therefore, the maximum extension speed is inversely proportional to the overall extension of the rails (see fig. 22). The maximum extension speed is also directly related to the applied load and operating time. The indicated data refers to continuous operation at the maximum load capacity.

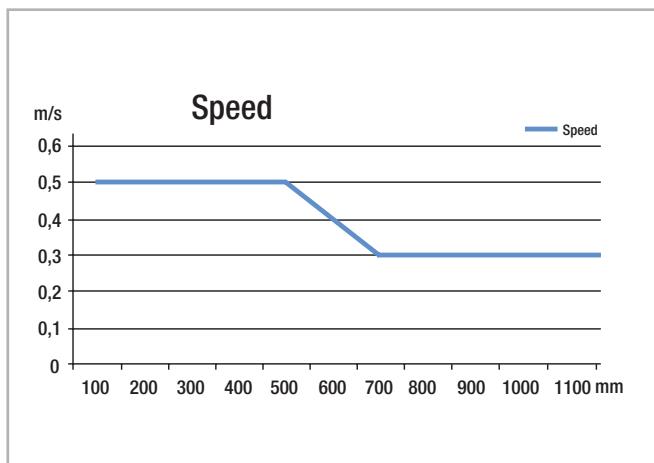

Fig. 22

> Temperature

Continual operating temperature is -20°C to +80°C for LRS and +10°C to +40°C for LFS. The temperature range may vary according to the application (duration of exposure, impact, other forces on the rail, etc). Please contact our Technical Department.

> Installation instructions

- The existing internal stops are not designed to stop the moving load. They are only supposed to retain the ball-cage and prevent the internal parts to slide out of the assembly. An external end-stop must always be installed to stop the moving load.
- The rails perform best when mounted in a very rigid construction (furniture, device or installation). Do not use the rails as a structural part of a construction.
- To achieve optimum running properties, high service life and rigidity, it is necessary to fix the Light Rail extensions with all accessible holes on a rigid and level surface. Please observe the parallelism of the installation surfaces. The fixed and movable rails fit to the rigid assembly construction.
- Light Rail full and partial extensions are suitable for use in automatic systems. For this, the stroke should remain constant in all moving cycles and the extension speed must be checked (see pg. LR-22, fig.22). The movement of the extensions is enabled by internal ball cages, which could experience an offset from the original position with differing strokes. This phase offset can have a negative effect on the running properties or limit the stroke. If differing strokes occur in an application, the drive force must be sufficiently dimensioned in order to appropriately synchronize the ball cage offset. As an alternative, an extra full stroke cycle can be performed every certain number of cycles, in order to re-phase the ball cage in its correct position.

Ordering key

> Light Rail

LRS	71-	400					
Rail length in mm		<i>see from pg. LR-6</i>					
Size	<i>see from pg. LR-6</i>						
Rail type	<i>see from pg. LR-6</i>						

Ordering example: LRS71-0400

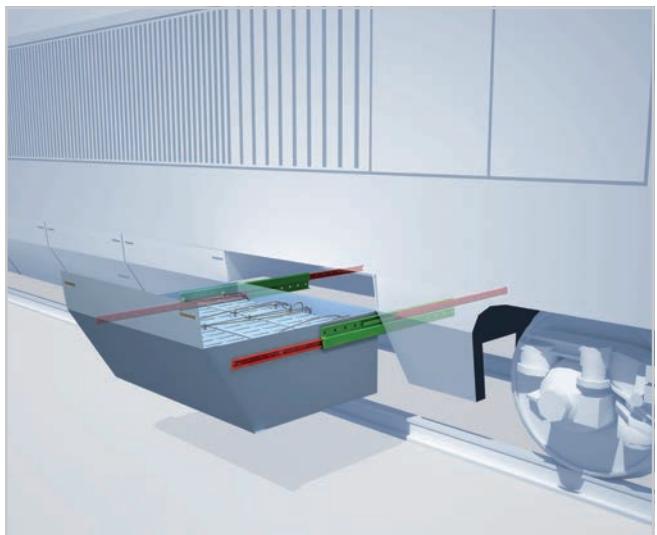

Notes on ordering: The rail lengths are always indicated as 4 digits with 0 prefixes

TO SUPPORT YOU, WE DESIGN AND PRODUCE

Rollon's goal is to support you become **more competitive in your markets**, through technological solutions, design simplification, productivity, reliability, duration, and low maintenance.

We offer everything from **individual components to specifically designed**, mechanically integrated systems: the quality of our applications is an expression of our technology and competence.

ROLLONLAB: EXPERIMENTATION AND INNOVATION

RollonLab, a specialized laboratory where new products created by the R&D department are tested and optimized to perform beyond their technical limits through performance tests and strict quality controls.

RollonLab also tests products in simulations of different application scenarios, to guarantee that the client receives **highly competitive custom products**.

SUPPORT & CUSTOMIZATION

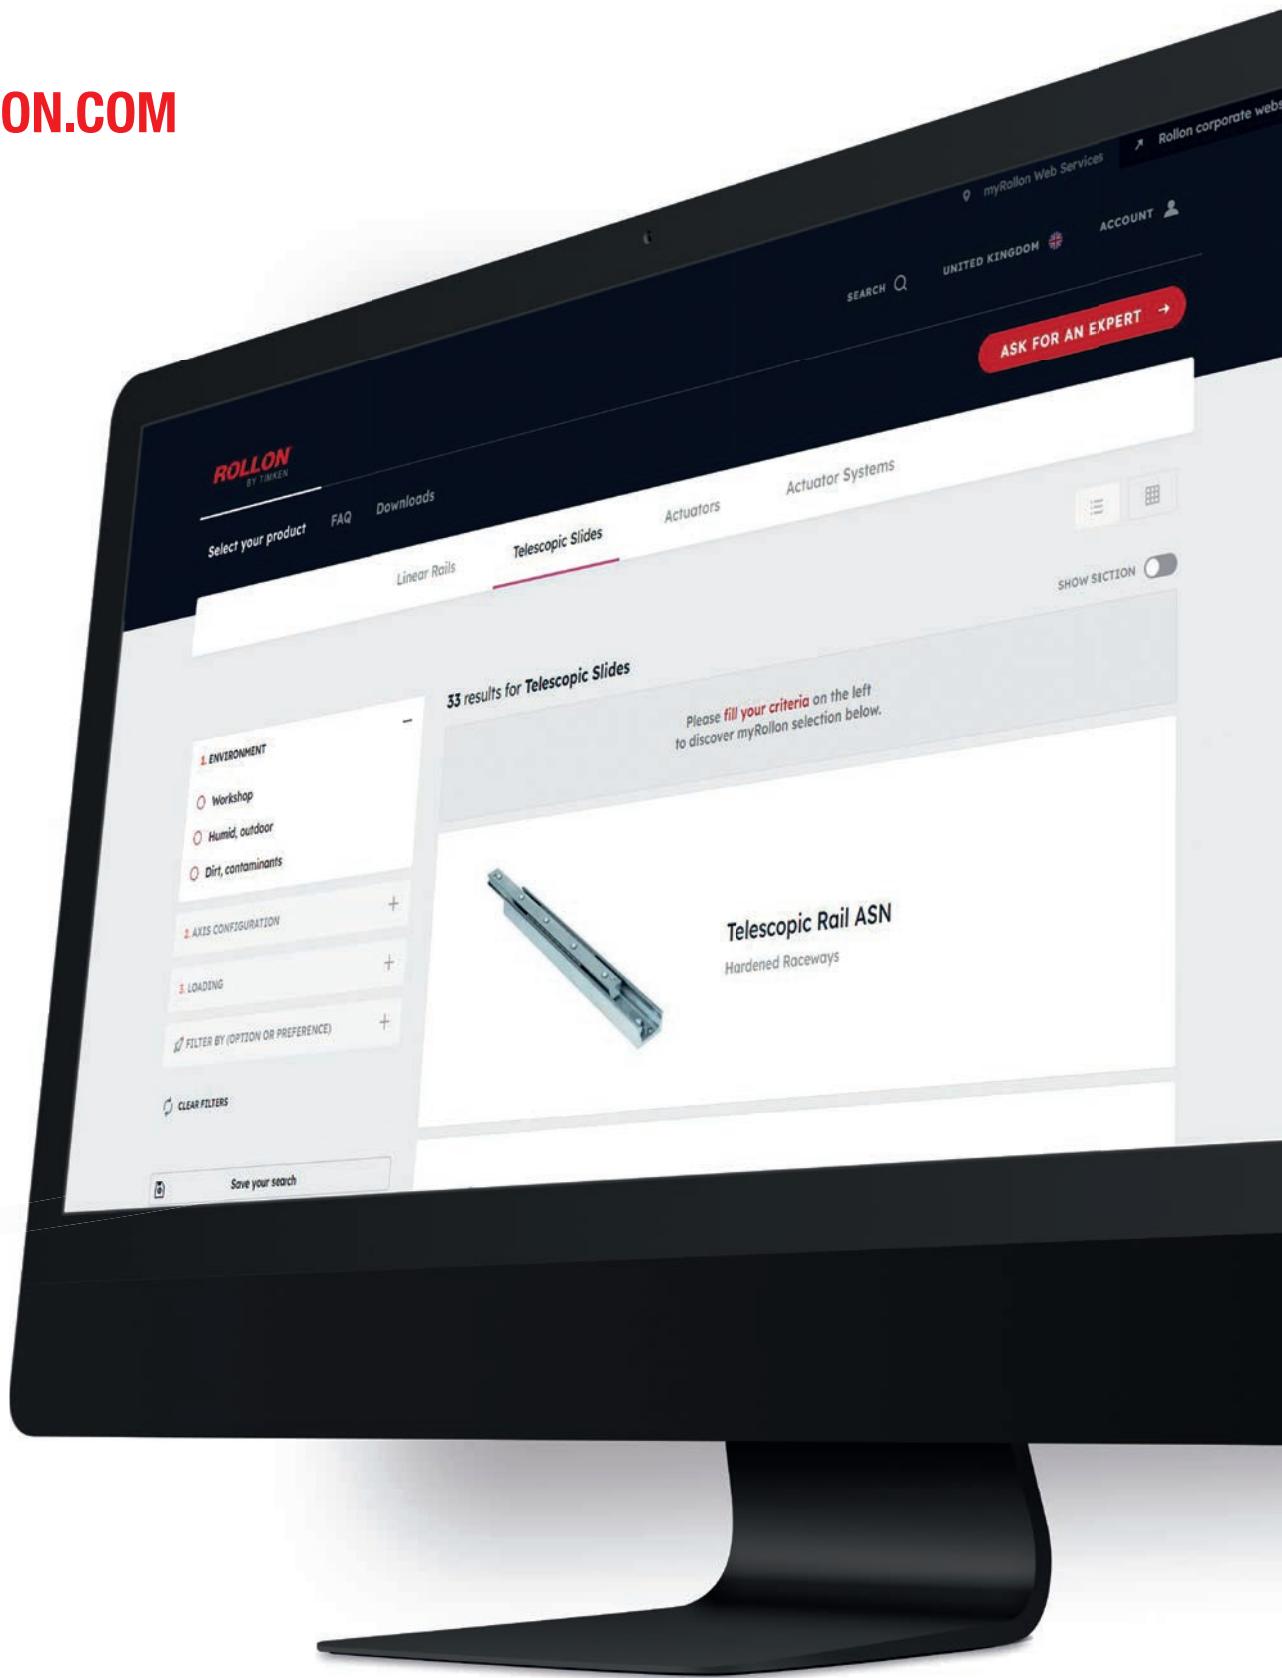

- Product training
- Custom product prototyping
- Application sizing and engineering
- 2D / 3D product drawings on demand
- On-site support for first installation and mock-ups
- Co-design service on sub-systems and full assemblies
- Internal laboratory for static abuse load and endurance tests

Thanks to the experience acquired through years of applications and research, we are able to provide high quality products specifically designed for your needs.

A NEW **DIGITAL EXPERIENCE**
SURROUNDED BY **ROLLON EXPERTS**
WHERE YOU CAN EASILY SELECT
THE PRODUCT **YOU NEED.**
